

Vivante Programming: VGLite® Vector Graphics API

Note: This document is released as part of PSOC™-E84 Early Access Pack (EAP).

About this document

Scope and purpose

This document describes various graphics APIs available for user to make use of GPU in PSOC™ Edge Devices.

Intended audience

This document is intended for anyone who wants to offload the graphics operations to GPU in PSOC™ Edge Devices.

Introduction

1 Introduction

Vivante's platform independent VGLite Graphics API (Application Programming Interface) is designed to support 2D vector and 2D raster-based operations for rendering interactive user interface that may include menus, fonts, curves, and images. Its goal is to provide the maximum 2D vector/raster rendering performance, while keeping the memory footprint to the minimum. The Vivante VGLite Graphics API allows users to implement customized applications for mobile or IoT devices that include Vivante Vector Graphics IP.

1.1 Vivante VGLite Graphics API

VGLite APIs for GCNanoUltraV is used to control the vector graphics hardware units present in PSOC Edge MCU, which provide accelerated vector and raster operations.

VGLite APIs for GCNanoUltraV is developed for use with GCNanoUltraV hardware. VGLite API driver V4 can generate the most CPU efficient, customized driver build for a specific 2.5D GPU release based on the hardware feature set. VGLite API supported features include Porter-Duff Blending, Gradient Controls, Fast Clear, Arbitrary Rotations, Path Filling rules, Path painting, and Pattern Path Filling.

GCNanoUltraV have limited feature set that are required to pass Khronos OpenVG CTS.

By default, VGLite API driver V4 supports one implicit global application context in single thread. VGLite V4 driver does not support multi-threaded application which is not suitable for embedded IoT devices.

1.2 API Function Group

VGLite Graphics API has been designed to have independent function groups. It is permissible for user to use only one of the function groups in the VGLite application.

- **Initialization** – Used for initializing hardware and software structures.
- **Blit API** – Used for the raster part of rendering.
- **Draw API** – Used for 2D vector-based draw operations

1.3 API files

For customers with access to source:

VGLite Graphics API functions are defined in the header file *vg_lite.h*.

All VGLite application used enumerations and data types are also defined in *vg_lite.h*.

Introduction

1.4 Hardware Versions

The VGLite APIs for GCNanoUltraV is compatible with a range of Vivante Vector Graphics IPs including: GCNanoLiteV, GCNanoUltraV, GCNanoV.

Note that a specific hardware version has customized feature set which may limit hardware support for some VGLite API options. The VGLite application can use [vg_lite_query_feature](#) API to query specific VGLite feature availability.

Users can also check the *vg_lite_options.h* file which includes CHIPID, REVISION, CID to identify specific HW releases, and `gcFEATURE_VG_*` macros to define the feature set for the HW release.

The `gcFEATURE_VG_*` macro values (except a few SW features) should NOT be changed. Otherwise, the VGLite driver will not function correctly on the specific HW release. Users can change the “SW Features” macro values to disable some software features, unnecessary error checks, or enable VGLite API trace for debug purposes.

Common Parameters and Error Values

2 Common Parameters and Error Values

2.1 Common Parameters

VGLite Graphics API uses a naming convention scheme wherein definitions are preceded by “vg_lite”.

Below is the list of most proprietary defined types and structures in the drivers. Not all may be used in the API functions.

Table 1 Common Parameter Types

Name	Typedef	Value
vg_lite_bool_t	int	A signed 32-bit integer 0: FALSE; 1: TRUE.
vg_lite_int8_t	char	A signed 8-bit integer
vg_lite_uint8_t	unsigned char	An unsigned 8-bit integer
vg_lite_int16_t	short	A signed 16-bit integer
vg_lite_uint16_t	unsigned short	An unsigned 16-bit integer
vg_lite_int32_t	int	A signed 32-bit integer
vg_lite_uint32_t	unsigned int	An unsigned 32-bit integer
vg_lite_uint64_t	unsigned long long	An unsigned 64-bit integer
vg_lite_float_t	float	A 32-bit single precision floating point number
vg_lite_double_t	double	A 64-bit double precision floating point number
vg_lite_char_t	char	A signed 8-bit integer
vg_lite_string	char*	A pointer to a character string
vg_lite_pointer	void*	A generic address pointer (void *). On 32-bit OS, it is a 32-bit address pointer. On 64-bit OS, it is a 64-bit address pointer.
vg_lite_void	void	The void type
vg_lite_color_t	vg_lite_uint32_t	A 32-bit color value The color value specifies the color used in various functions. The color is formed using 8-bit RGBA channels. The red channel is in the lower 8-bit of the color value, followed by the green and blue channels. The alpha channel is in the upper 8-bit of the color value.
VG_LITE_S8	enum vg_lite_format_t	A signed 8-bit integer coordinate
VG_LITE_S16	enum vg_lite_format_t	A signed 16 bit integer coordinate
VG_LITE_S32	enum vg_lite_format_t	A signed 32-bit integer coordinate

Common Parameters and Error Values

Name	Typedef	Value
VG_LITE_FP32	enum vg_lite_format_t	A 32-bit floating point coordinate

2.2 Enumeration used for Error Reporting

2.2.1 [vg_lite_error_t](#) Enumeration

Most functions in the API include an error status via the [vg_lite_error_t](#) enumeration. API functions return the status of the command and will report **VG_LITE_SUCCESS** if successful with no errors. Possible error values include the values in the table below.

Used in many functions, including initialization, flush, blit, draw, gradient and pattern functions.

vg_lite_error_t String Values	Description
VG_LITE_GENERIC_IO	Cannot communicate with the kernel driver
VG_LITE_INVALID_ARGUMENT	Invalid argument specified
VG_LITE_MULTI_THREAD_FAIL	Multi-thread/tasks fail (<i>available from June 2020</i>)
VG_LITE_NO_CONTEXT	No context specified
VG_LITE_NOT_SUPPORT	Function call not supported. Hardware support not available.
VG_LITE_OUT_OF_MEMORY	Out of memory (driver heap)
VG_LITE_OUT_OF_RESOURCES	Out of resources (OS heap)
VG_LITE_SUCCESS	Successful with no errors
VG_LITE_TIMEOUT	Timeout
VG_LITE_ALREADY_EXISTS	Object already exists (<i>available from August 2021</i>)
VG_LITE_NOT_ALIGNED	Data alignment error (<i>available from August 2021</i>)

Hardware Product and Feature Information

3 Hardware Product and Feature Information

These query functions can be used to identify the product and its key features, and to get VGLite driver information.

3.1 Enumerations for Product and Feature Queries

3.1.1 `vg_lite_feature_t` Enumeration

The following feature values may be queried for availability in compatible hardware. *(expanded March 2023 to support additional hardware for driver V4)*

Used in information functions: `vg_lite_query_feature`.

<code>vg_lite_feature_t</code> String Values	Description
<code>gcFEATURE_BIT_VG_16PIXELS_ALIGN</code>	Require 16 pixels aligned for input pixel buffer
<code>gcFEATURE_BIT_VG_24BIT</code>	RGB888 or RGBA5658 formats support
<code>gcFEATURE_BIT_VG_24BIT_PLANAR</code>	24 bit planar formats support
<code>gcFEATURE_BIT_VG_AYUV_INPUT</code>	AYUV input format support
<code>gcFEATURE_BIT_VG_BORDER_CULLING</code>	Border culling support
<code>gcFEATURE_BIT_VG_COLOR_KEY</code>	Color key support.
<code>gcFEATURE_BIT_VG_COLOR_TRANSFORMATION</code>	Color transform support.
<code>gcFEATURE_BIT_VG_DEC_COMPRESS</code>	DEC compression format output support
<code>gcFEATURE_BIT_VG_DITHER</code>	Dither support
<code>gcFEATURE_BIT_VG_DOUBLE_IMAGE</code>	Support two image source inputs
<code>gcFEATURE_BIT_VG_FLEXA</code>	FLEXA interface support
<code>gcFEATURE_BIT_VG_GAMMA</code>	Gamma support
<code>gcFEATURE_BIT_VG_GAUSSIAN_BLUR</code>	Gaussian blur sampling support
<code>gcFEATURE_BIT_VG_GLOBAL_ALPHA</code>	Global alpha support
<code>gcFEATURE_BIT_VG_HW_PREMULTIPLY</code>	HW supports alpha premultiply for image
<code>gcFEATURE_BIT_VG_IM_DEC_INPUT</code>	DEC compressed format input support
<code>gcFEATURE_BIT_VG_IM_FASTCLEAR</code>	Fast Clear support
<code>gcFEATURE_BIT_VG_IM_INDEX_FORMAT</code>	Index format support for image
<code>gcFEATURE_BIT_VG_IM_INPUT</code>	Blit and draw API support
<code>gcFEATURE_BIT_VG_IM_REPEAT_REFLECT</code>	Image repeat reflect mode support
<code>gcFEATURE_BIT_VG_INDEX_ENDIAN</code>	Index format endian support
<code>gcFEATURE_BIT_VG_LINEAR_GRADIENT_EXT</code>	Support for extended linear gradient capabilities
<code>gcFEATURE_BIT_VG_LVGL_SUPPORT</code>	LVGL blend mode support
<code>gcFEATURE_BIT_VG_MASK</code>	Mask support
<code>gcFEATURE_BIT_VG_MIRROR</code>	Mirror support
<code>gcFEATURE_BIT_VG_NEW_BLEND_MODE</code>	New blend mode DARKEN/LIGHTEN support
<code>gcFEATURE_BIT_VG_NEW_IMAGE_INDEX</code>	New CLUT image index support
<code>gcFEATURE_BIT_VG_PARALLEL_PATHS</code>	New parallel path HW support

Hardware Product and Feature Information

vg_lite_feature_t String Values	Description
gcFEATURE_BIT_VG_PE_CLEAR	Pixel engine clear support
gcFEATURE_BIT_VG_PIXEL_MATRIX	Pixel matrix support
gcFEATURE_BIT_VG_QUALITY_8X	8x anti-aliasing path support
gcFEATURE_BIT_VG_RADIAL_GRADIENT	Radial gradient support
gcFEATURE_BIT_VG_RECTANGLE_TILED_OUT	Rectangle tiled output support
gcFEATURE_BIT_VG_RGBA2_FORMAT	RGBA2222 format support
gcFEATURE_BIT_VG_RGBA8_ETC2_EAC	ETC2/EAC compressed image format support
gcFEATURE_BIT_VG_SCISSOR	Scissor support
gcFEATURE_BIT_VG_SRC_PREMULTIPLIED	Source image alpha premultiplied
gcFEATURE_BIT_VG_STENCIL	Stencil image mode support
gcFEATURE_BIT_VG_STRIPE_MODE	Stripe mode support
gcFEATURE_BIT_VG_TESSELLATION_TILED_OUT	Tessellation tiled output support
gcFEATURE_BIT_VG_USE_DST	Read destination pixel support
gcFEATURE_BIT_VG_YUV_INPUT	YUV input format support
gcFEATURE_BIT_VG_YUV_OUTPUT	YUV format output support
gcFEATURE_BIT_VG_YUV_TILED_INPUT	YUV tiled input format support
gcFEATURE_BIT_VG_YUY2_INPUT	YUY2 input format support

3.2 Structures for Product and Feature Queries

3.2.1 vg_lite_info_t Structure

This structure is used to query VGLite driver information.

Used in function: `vg_lite_get_info_t`

vg_lite_info_t Members	Type	Description
api_version	vg_lite_uint32_t	VGLite API version
header_version	vg_lite_uint32_t	VGLite header version
release_version	vg_lite_uint32_t	VGLite driver release version
reserved	vg_lite_uint32_t	Reserved for future use

Hardware Product and Feature Information**3.3 Functions for Product and Feature Queries****3.3.1 vg_lite_get_product_info****Description**

This function is used to identify the VGLite compatible product.

Syntax

```
vg_lite_uint32_t vg_lite_get_product_info (  
    vg_lite_char          *name  
    vg_lite_uint32_t      *chip_id  
    vg_lite_uint32_t      *chip_rev  
) ;
```

Parameters

*name	Character array to store the name of the chip.
*chip_id	Stores an ID number for the chip.
*chip_rev	Stores a revision number for the chip.

3.3.2 vg_lite_get_info**Description**

This function is used to query the VGLite driver information.

Syntax

```
vg_lite_error_t vg_lite_get_info (  
    vg_lite_info_t      *info  
) ;
```

Parameters

*info	Points to the VGLite driver information structure which includes the API version, header version, and release version.
-------	--

Hardware Product and Feature Information

3.3.3 `vg_lite_get_register`

Description

This function can be used to read a Vivante Vector Graphics register value given the AHB Byte address of a register. Refer to Vivante Vector Graphics Accessible Register specification documents compatible with your IP for register descriptions. The value range of AHB/APB accessible addresses for VGLite cores is usually 0x0 to 0x1FF and 0xA00 to 0xA7F.

Syntax

```
vg_lite_error_t vg_lite_get_register (  
    vg_lite_uint32_t      address  
    vg_lite_uint32_t      *result  
) ;
```

Parameters

address	Byte Address of the register whose value you want.
*result	The registers value.

3.3.4 `vg_lite_query_feature`

Description

This function is used to query if a specific feature is available.

Syntax

```
vg_lite_uint32_t vg_lite_query_feature (  
    vg_lite_feature_t      feature  
) ;
```

Parameters

feature	Feature being queried, as detailed in enum vg_lite_feature_t .
---------	--

Returns

Either the feature is not supported (0) or supported (1).

Hardware Product and Feature Information**3.3.5 vg_lite_get_mem_size****Description**

This function queries whether or not there is any remaining allocated contiguous video memory (*available from June 2020*).

Syntax

```
vg_lite_error_t vg_lite_get_mem_size(  
    vg_lite_uint32_t    *size  
) ;
```

Parameters

size	Pointer to the remaining allocated contiguous video memory.
------	---

Returns

Returns VG_LITE_SUCCESS if the query is successful and memory is available. Returns VG_LITE_NO_CONTEXT if the driver is not initialized, or there is no available memory.

API Control

4 API Control

Before calling any VGLite API function, the application must initialize the VGLite implicit (global) context by calling `vg_lite_init()`, which will fill in a features table, reset the fast-clear buffer, reset the compositing target buffer, as well as allocate the command and tessellation buffers.

The VGLite driver only supports one current context and one thread to issue commands to the Vivante Vector Graphics hardware. The VGLite driver does not support multiple concurrent contexts running simultaneously in multiple threads/processes, as the VGLite kernel driver does not support context switching. A VGLite application can only use a single context at any time to issue commands to the Vivante Vector Graphics hardware. If a VGLite application needs to switch contexts, `vg_lite_close()` should be called to close the current context in the current thread, then `vg_lite_init()` can be called to initialize a new context either in the current thread or from another thread/process.

4.1 Context Initialization and Control Functions

4.1.1 `vg_lite_init`

Description

This function initializes the memory and data structures needed for VGLite draw/blit functions, by allocating memory for the command buffer and a tessellation buffer of the specified size. The tessellation buffer width & height must be a multiple of 16. The tessellation window can be specified based on the amount of memory available in the system and the desired performance. A smaller window can have a lower memory footprint but may result in lower performance. The minimum window that can be used for tessellation is 16x16. If the height or width is less than 0, then no tessellation buffer is created, thus it can be used in a blit-only case.

If this would be the first context that accesses the hardware, the hardware will be turned on and initialized. If a new context needs to be initialized, `vg_lite_close` must be called to close the current context. Otherwise, `vg_lite_init` will return an error.

Syntax

```
vg_lite_error_t vg_lite_init (
    vg_lite_int32_t      tess_width,
    vg_lite_int32_t      tess_height
);
```

Parameters

tess_width	Width of tessellation window. Value should be a multiple of 16; minimum width is 16 pixels, maximum cannot be greater than frame width. If less than or equal to 0, then no tessellation buffer is created, in which case the function is used for a blit init
tess_height	Height of tessellation window. Value should be a multiple of 16; minimum height is 16 pixels, maximum cannot be greater than frame height. If less than or equal to 0, then no tessellation buffer is created, in which case the function is used for a blit init.

API Control

4.1.2 `vg_lite_close`

Description

This function will deallocate all the resource and free up all the memory that was initialized earlier by the `vg_lite_init` function. It will also turn OFF the hardware automatically if this was the only active context.

Syntax

```
vg_lite_error_t vg_lite_close (  
    void  
) ;
```

4.1.3 `vg_lite_finish`

Description

This function explicitly submits the command buffer to the GPU and waits for it to complete.

Syntax

```
vg_lite_error_t vg_lite_finish (  
    void  
) ;
```

4.1.4 `vg_lite_flush`

Description

This function explicitly submits the command buffer to the GPU without waiting for it to complete. *(From Dec 2019, return type is `vg_lite_error_t`, previously was `void`.)*

Syntax

```
vg_lite_error_t vg_lite_flush (  
    void  
) ;
```

Returns

Returns `VG_LITE_SUCCESS` if the flush is successful. See [vg_lite_error_t](#) enum for other return codes.

API Control

4.1.5 **vg_lite_set_command_buffer_size****Description**

This function is optional. If used, call it before `vg_lite_init` if you want to change the command buffer size. *(available from March 2020)*

This function is useful for devices where memory is limited and less than the default. The VGLite Command buffer is set to 32K by default, so that VGLite applications can render more complex paths with better performance. This function can be used to adjust the command buffer size to fit specific application and system/device requirements.

Syntax

```
vg_lite_error_t vg_lite_set_command_buffer_size (
    vg_lite_uint32_t      size
);
```

Parameters

size	Size of the VGLite Command buffer. Default is 64K.
------	--

4.1.6 **vg_lite_set_command_buffer****Description**

This function sets a user-defined external memory buffer (physical, 64-byte aligned) as the VGLite command buffer. By default, the VGLite driver allocates a static command buffer internally. Thus, it is not necessary for an application to allocate and set the command buffer. This function is only used for devices where an application needs to allocate the command buffer dynamically. *(from December 2021)*

Syntax

```
vg_lite_error_t vg_lite_set_command_buffer (
    vg_lite_uint32_t      physical,
    vg_lite_uint32_t      size
);
```

Parameters

physical	The physical address of a memory buffer. The address must be 64-byte aligned.
size	The size of memory buffer. The size must be 128-byte aligned.

Returns

Returns `VG_LITE_SUCCESS` if the command buffer set is successful. See `vg_lite_error_t` enum for other return codes.

API Control

4.1.7 `vg_lite_set_tess_buffer`

Description

This function specifies a memory buffer from an application as the VGLite driver's tessellation buffer. By default, the VGLite driver allocates a static tessellation buffer internally. Thus, it is not necessary for an application to allocate and set the tessellation buffer. This function is only used for devices where the application needs to allocate the tessellation buffer dynamically. *(from December 2021)*

Syntax

```
vg_lite_error_t vg_lite_set_tess_buffer (  
    vg_lite_uint32_t      physical,  
    vg_lite_uint32_t      size  
);
```

Parameters

physical	The physical address of a tessellation buffer. The address must be 64-byte aligned.
size	The size of tessellation buffer. tessellation buffer size = target buffer's height * 128B.

Returns

Returns VG_LITE_SUCCESS if the tessellation buffer set is successful. See [vg_lite_error_t](#) enum for other return codes.

Pixel Buffers

5 Pixel Buffers

5.1 Pixel Buffer Alignment

The VGLite hardware requires the pixel buffer start address and stride to be properly byte aligned to work correctly. The start address and stride alignment requirement for a pixel buffer depends on the specific pixel format, and gcFEATURE_VG_16PIXELS_ALIGNED value (0/1) in vg_lite_options.h file.

Refer to the [Alignment notes](#) Table 2: Image Source Start Address and Stride Alignment Summary later in this document.

5.2 Pixel Cache

The Vivante Imaging Engine (IM) includes two fully associative caches. Each cache has 8 lines, each line has 64 bytes. In this case, one cache line can hold either a 4x4-pixel Tile or a 16x1-pixel row.

5.3 Internal Representation

For non 32-bit color formats, each pixel will be extended to 32-bits as such:

If the source and destination formats have the same color format, but differ in the number of bits per color channel, the source channel is multiplied by $(2^d - 1)/(2^s - 1)$ and rounded to the nearest integer.

Where,

- **d** is the number of bits in the destination channel
- **s** is the number of bits in the source channel

Example: a b11111 5-bit source channel gets converted to an 8-bit destination b11111000.

The YUV formats are internally converted to RGB. Pixel selection is unified for all formats by using the LSB of the coordinate.

5.4 Pixel Buffer Enumerations

5.4.1 vg_lite_buffer_format_t Enumeration

This enumeration specifies the color format to use for a buffer. This applies to both Image and Render Target. Formats include supported swizzles for RGB. For YUV swizzles, use the related values and parameters in vg_lite_swizzle_t.

Application can use [vg_lite_query_feature](#) API to determine support for some hardware dependent formats. For example, related vg_lite_feature_t enum values include gcFEATURE_BIT_VG_RGBA2_FORMAT and gcFEATURE_BIT_VG_IM_INDEX_FORMAT.

Note: See [Alignment notes](#) Table 2 following the value descriptions for alignment requirements summary for the image formats. (*alignment columns refined March and Sept 2023*)

Used in structure: vg_lite_buffer_t.

See also vg_lite_blit, vg_lite_clear, vg_lite_draw.

Pixel Buffers

OpenVG VGImageFormat Note: The bits for each color channel are stored within a machine word from MSB to LSB in the order indicated by the pixel format name. This is the opposite of the original VG_LITE_* formats which are ordered from LSB to MSB. Formats with the same organization are listed in the same row as their VG_Lite counterparts.

Original VGLite API Image Format Note: The bits for each color channel are stored within a machine word from LSB to MSB in the order indicated by the pixel format name. This is the opposite of the OPENVG VG_* formats which are ordered from MSB to LSB.

The following codes, as also used in OpenVG 1.1 Specification Table 11, are used for format description:

- A: Alpha channel
- B: Blue color channel
- G: Green color channel
- R: Red color channel
- X: Uninterpreted padding byte or bit
- L: Grayscale
- BW: 1-bit black and white
- L: Linear color space
- s: Non-linear (sRGB) color space
- PRE: Alpha values are premultiplied

5.4.1.1 Alignment Notes

Source Image Alignment Requirement

The buffer start address and stride byte-alignment requirement for a pixel depends on the specific pixel format, and `gcFEATURE_VG_16PIXELS_ALIGNED` value (0/1) in `vg_lite_options.h` file.

Table 2 Image Source Buffer Start Address and Stride Alignment Summary
(Start Address / Stride columns updated for some formats March and Sept 2023)

Image Format	Bits per pixel	Start Address Alignment Requirement in Bytes	Stride Alignment Requirement in Bytes	Supported for Source IMAGE	Supported for Destination
VG_LITE_INDEX1	1	8B	8B	Yes	
VG_LITE_INDEX2	2	8B	8B	Yes

VG_LITE_ANV12_TILED	Tile 4x4	Y: 16B UV: 8B	Y: 16B UV: 8B	Yes	

Pixel Buffers

VG_LITE_AYUY2_TILED	Tile 4x4	32B	32B	Yes	
---------------------	-------------	-----	-----	-----	--

VGLite hardware requires the raster image width to be a multiple of 16 pixels for linear gradient and radial gradient operations. This requirement applies to all image formats. Therefore, the user needs to pad an arbitrary image width to a multiple of 16 pixels for VGLite linear gradient and radial gradient APIs.

Destination Alignment Requirement

- For Pixel Engine (PE) destination, the alignment should be 64B for all tiled (4x4) formats.
- Alignment may also be limited by the alignment requirements of backend modules such as DC (Display Controller).

5.4.2 vg_lite_buffer_layout_t Enumeration

Specifies the buffer data layout in memory.

Used in structure: `vg_lite_buffer`.

vg_lite_buffer_layout_t String Value	Description
VG_LITE_LINEAR	Linear (scanline) layout.
VG_LITE_TILED	Data is organized in 4x4 pixel tiles. Note: for this layout, the buffer start address and stride need to be 64 byte aligned.

5.4.3 vg_lite_compress_mode_t Enumeration

Specifies the DECNano compression mode. *(from March 2023)*

Used in structure: `vg_lite_buffer_t`.

vg_lite_compress_mode_t String Value	Description
VG_LITE_DEC_DISABLE	Disable compression.
VG_LITE_DEC_NON_SAMPLE	compression ratio is 1.6 for ARGB8888, 2.0 for XRGB8888
VG_LITE_DEC_HSAMPLE	compression ratio is 2.0 for ARGB8888, 2.6 for XRGB8888
VG_LITE_DEC_HV_SAMPLE	compression ratio is 2.6 for ARGB8888, 4.0 for XRGB8888

5.4.4 vg_lite_gamma_conversion_t Enumeration

Specifies the gamma conversion mode. *(from Sept 2022)*

Used in function: `vg_lite_set_gamma`.

vg_lite_gamma_conversion_t String Value	Description
VG_LITE_GAMMA_NO_CONVERSION	Leave color as is.
VG_LITE_GAMMA_LINEAR	Convert from sRGB to linear.
VG_LITE_GAMMA_NON_LINEAR	Convert from linear to sRGB space.

Pixel Buffers

5.4.5 `vg_lite_index_endian_t` Enumeration

Specifies the endian order parsing mode for index formats. *(from March 2023)*

Used in structure: `vg_lite_buffer_t`.

<code>vg_lite_index_endian_t</code> String Value	Description
<code>VG_LITE_INDEX_ENDIAN_LITTLE_ENDIAN</code>	Parse the index pixel from low to high, when using index1, the parsing order is bit0~bit7. when using index2, the parsing order is bit0:1,bit2:3,bit4:5,bit6:7. when using index4, the parsing order is bit0:3,bit4:7.
<code>VG_LITE_INDEX_ENDIAN_BIG_ENDIAN</code>	Parse the index pixel from low to high, when using index1, the parsing order is bit7~bit0. when using index2, the parsing order is bit7:6,bit5:4,bit3:2,bit1:0. when using index4, the parsing order is bit4:7,bit0:3.

5.4.6 `vg_lite_image_mode_t` Enumeration

Specifies how an image is rendered onto a buffer. *(prior to Sept 2022 name was `vg_lite_buffer_image_mode_t`)*

Used in structure: `vg_lite_buffer_t`.

<code>vg_lite_image_mode_t</code> String Value	Description
<code>VG_LITE_ZERO</code>	
<code>VG_LITE_NORMAL_IMAGE_MODE</code>	Image drawn with blending mode
<code>VG_LITE_MULTIPLY_IMAGE_MODE</code>	Image is multiplied with paint color
<code>VG_LITE_STENCIL_MODE</code>	
<code>VG_LITE_NONE_IMAGE_MODE</code>	Image input is ignored
<code>VG_LITE_RECOLOR_MODE</code>	

5.4.7 `vg_lite_map_flag_t` Enumeration

Specifies whether mapping is for user memory or the DMA buffer. *(from March 2023)*

Used in function: `vg_lite_map`.

<code>vg_lite_map_flag_t</code> String Value	Description
<code>VG_LITE_MAP_USER_MEMORY</code>	Mapping is for user memory.
<code>VG_LITE_MAP_DMABUF</code>	Mapping is for the DMA buffer.

Pixel Buffers

5.4.8 `vg_lite_paint_type_t` Enumeration

Specifies paint type. *(from May 2023)*

Used in structure: `vg_lite_buffer_t`.

<code>vg_lite_paint_type_t</code> String Value	Description
<code>VG_LITE_PAINT_ZERO</code>	
<code>VG_LITE_PAINT_COLOR</code>	Color
<code>VG_LITE_PAINT_LINEAR_GRADIENT</code>	Linear Gradient
<code>VG_LITE_PAINT_RADIAL_GRADIENT</code>	Radial Gradient
<code>VG_LITE_PAINT_PATTERN</code>	Pattern

5.4.9 `vg_lite_transparency_t` Enumeration

Specifies the transparency mode for a buffer. *(prior to Sept 2022 name was `vg_lite_buffer_transparency_mode_t`)*

Used in structure: `vg_lite_buffer`.

<code>vg_lite_transparency_t</code> String Value	Description
<code>VG_LITE_IMAGE_OPAQUE</code>	Opaque image: all image pixels are copied to the VG PE for rasterization
<code>VG_LITE_IMAGE_TRANSPARENT</code>	Transparent image: only the non-transparent image pixels are copied to the VG PE. Note: this mode is only valid when <code>IMAGE_MODE</code> (<code>vg_lite_image_mode_t</code>) is either <code>VG_LITE_NORMAL_IMAGE_MODE</code> or <code>VG_LITE_MULTIPLY_IMAGE_MODE</code> .

5.4.10 `vg_lite_swizzle_t` Enumeration

This enumeration specifies the swizzle for the UV components of YUV data.

Used in structure: `vg_lite_yuvinfo`.

<code>vg_lite_swizzle_t</code> String Value	Description
<code>VG_LITE_SWIZZLE_UV</code>	U in lower bits, V in upper bits
<code>VG_LITE_SWIZZLE_VU</code>	V in lower bits, U in upper bits

Pixel Buffers

5.4.11 vg_lite_yuv2rgb_t Enumeration

This enumeration specifies the standard for conversion of YUV data to RGB data.

Used in structure: `vg_lite_yuvinfo`.

vg_lite_yuv2rgb_t String Value	Description
VG_LITE_YUV601	YUV Converting with ITC.BT-601 standard
VG_LITE_YUV709	YUV Converting with ITC.BT-709 standard

5.5 Pixel Buffer Structures

5.5.1 vg_lite_buffer_t Structure

This structure defines the buffer layout for a VGLite image or memory data.

Used in structures: `vg_lite_linear_gradient_t`, `vg_lite_radial_gradient_t`.

Used in init functions: `vg_lite_allocate`, `vg_lite_free`, `vg_lite_upload_buffer`, `vg_lite_map`, `vg_lite_unmap`.

Used in blit functions: `vg_lite_blit`, `vg_lite_blit_rect`, `vg_lite_clear`, `vg_lite_create_masklayer`, `vg_lite_fill_masklayer`, `vg_lite_blend_masklayer`, `vg_lite_set_masklayer`, `vg_lite_render_masklayer`, `vg_lite_destroy_masklayer`,

Used in draw functions: `vg_lite_draw`, `vg_lite_draw_pattern`, `vg_lite_draw_grad`, `vg_lite_draw_radial_grad`.

vg_lite_buffer_t Members	Type	Description
width	<code>vg_lite_int32_t</code>	Width of buffer in pixels
height	<code>vg_lite_int32_t</code>	Height of buffer in pixels
stride	<code>vg_lite_int32_t</code>	Stride in bytes
tiled	vg_lite_buffer_layout_t	Linear or tiled format for buffer enum
format	vg_lite_buffer_format_t	color format enum
handle	<code>vg_lite_pointer</code>	memory handle
memory	<code>vg_lite_pointer</code>	pointer to the start address of the memory
address	<code>vg_lite_uint32_t</code>	GPU address
yuv	vg_lite_yuvinfo_t	YUV format info struct
image_mode	vg_lite_image_mode_t	Blit image mode enum
transparency_mode	vg_lite_transparency_t	Image transparency mode enum
fc_buffer[3]	<code>vg_lite_fc_buffer_t</code>	Three (3) fast clear buffers, reserved YUV format (<i>from March 2023</i>)
compress_mode	<code>vg_lite_compress_mode</code>	Compression mode (<i>from March 2023</i>)
index_endian	<code>vg_lite_index_endian_t</code>	Big/Little Endian setting for index formats (<i>from March 2023</i>)
paintType	vg_lite_paint_type_t	Paint type enum (<i>from May 2023</i>)
fc_enable	<code>vg_lite_int8_t</code>	Enable Image fast clear (<i>moved from Aug 2023</i>)
scissor_layer	<code>vg_lite_int8_t</code>	Get paintcolor from different paint type (<i>from Aug 2023</i>)

Pixel Buffers

vg_lite_buffer_t Members	Type	Description
premultiplied	vg_lite_int8_t	The RGB pixel values are alpha-premultiplied <i>(from Aug 2023)</i>

5.5.2 vg_lite_fc_buffer_t Structure

This structure defines the organization of a fast clear buffer. *(from March 2023)*

Used in structure: vg_lite_buffer_t.

vg_lite_fc_buffer_t Members	Type	Description
width	vg_lite_int32_t	Width of buffer in pixels
height	vg_lite_int32_t	Height of buffer in pixels
stride	vg_lite_int32_t	Stride in bytes
handle	vg_lite_pointer	memory handle as allocated by the VGLite kernel
memory	vg_lite_pointer	logical pointer to the start address of the memory for the CPU
address	vg_lite_uint32_t	address to the buffer's memory for the GPU hardware
color	vg_lite_uint32_t	The fast clear color value

5.5.3 vg_lite_yuvinfo_t Structure

This structure defines the organization of VGLite YUV data.

Used in structure: vg_lite_buffer_t.

vg_lite_yuvinfo_t Members	Type	Description
swizzle	vg_lite_swizzle_t	UV swizzle enum
yuv2rgb	vg_lite_yuv2rgb_t	YUV conversion standard enum
uv_planar	vg_lite_uint32_t	UV (U) planar address for GPU, generated by driver
v_planar	vg_lite_uint32_t	V planar address for GPU, generated by driver
alpha_planar	vg_lite_uint32_t	Alpha planar address for GPU, generated by driver
uv_stride	vg_lite_uint32_t	UV (U) stride in bytes
v_stride	vg_lite_uint32_t	V planar stride in bytes
alpha_stride	vg_lite_uint32_t	Alpha stride in bytes
uv_height	vg_lite_uint32_t	UV (U) height in pixels
v_height	vg_lite_uint32_t	V stride in bytes
uv_memory	vg_lite_pointer	Logical pointer to the UV (U) planar memory
v_memory	vg_lite_pointer	Logical pointer to the V planar memory
uv_handle	vg_lite_pointer	Memory handle of the UV (U) planar, generated by driver
v_handle	vg_lite_pointer	Memory handle of the V planar, generated by driver

Pixel Buffers**5.6 Pixel Buffer Functions****5.6.1 vg_lite_allocate****Description**

This function is used to allocate a buffer before using it in either blit or draw functions.

In order for the hardware to access some memory, like a source image or a target buffer, it needs to be allocated first. The supplied `vg_lite_buffer_t` structure needs to be initialized with the size (width and height) and format of the requested buffer. If the stride is set to zero, this function will fill it in. The only input parameter to this function is the pointer to the buffer structure. If the structure has all the information needed, appropriate memory will be allocated for the buffer.

This function will call the kernel to actually allocate the memory. The memory handle, logical address, and hardware addresses in the `vg_lite_buffer_t` structure will be filled in by the kernel.

Alignment Note: Though Vivante Vector Graphics hardware has an alignment requirement of 64 bytes, the VGLite Driver sets alignment to 128 bytes for render target buffer to conform to the alignment requirement of Vivante Display Controller. For source image buffer alignment requirement, see [Alignment Notes](#) Alignment Notes Table 3 following the `vg_lite_buffer_format_t` value descriptions.

Syntax

```
vg_lite_error_t vg_lite_allocate (  
    vg_lite_buffer_t      *buffer  
) ;
```

Parameters

*buffer	Pointer to the buffer that holds the size and format of the buffer being allocated. Either the memory or address field needs to be set to a non-zero value to map either a logical or physical address into hardware accessible memory.
---------	---

Returns

- VG_LITE_SUCCESS if the allocating contiguous buffer is allocated successfully.
- VG_LITE_OUT_OF_RESOURCES if there is insufficient memory in the host OS heap for the buffer
- VG_LITE_OUT_OF_MEMORY if allocation of a contiguous buffer failed.

Pixel Buffers

5.6.2 vg_lite_free

Description

This function is used to deallocate the buffer that was previously allocated. This will free up the memory for that buffer.

Syntax

```
vg_lite_error_t vg_lite_free (
    vg_lite_buffer_t      *buffer
);
```

Parameters

*buffer	Pointer to a buffer structure that was filled in by vg_lite_allocate.
---------	---

5.6.3 vg_lite_upload_buffer

Description

The function uploads the pixel data to a GPU memory buffer object. Note that the format of the data (pixel) to be uploaded must be the same as described in the buffer object. The input data memory buffer should contain enough data to be uploaded to the GPU buffer pointed by the input parameter “buffer”. *(replaces deprecated vg_lite_buffer_upload from Sept 2022)*

Note: Vivante Vector Graphics IP only uses data[0] and stride[0] as it does not support planar YUV formats.

Syntax

```
vg_lite_error_t vg_lite_upload_buffer (
    vg_lite_buffer_t      *buffer,
    vg_lite_uint8_t       *data[3],
    vg_lite_uint32_t       stride[3]
);
```

Parameters

*buffer	Pointer to a buffer structure that was filled in by vg_lite_allocate.
*data[3]	Pointer to pixel data. For YUV format, there may be up to 3 pointers.
stride[3]	Stride for the pixel data.

Pixel Buffers

5.6.4 vg_lite_map

Description

This function is used to map the memory appropriately for a particular buffer. For some operating systems, it will be used to get proper translation to physical or logical address of the buffer needed by the GPU.

If you want the use a frame buffer directly as a target buffer, you need to wrap a [vg_lite_buffer_t](#) structure around it and call the kernel to map the supplied logical or physical address into hardware accessible memory. For example, if you know the logical address of the frame buffer, set the memory field of the [vg_lite_buffer_t](#) structure with that address and call this function. If you know the physical address, set the memory field to NULL and program the address field with the physical address.

Syntax

```
vg_lite_error_t vg_lite_map (
    vg_lite_buffer_t      *buffer,
    vg_lite_map_flag_t    flag,
    int32_t               fd
);
```

Parameters

*buffer	Pointer to a buffer structure that was filled in by vg_lite_allocate .
flag	Enum vg_lite_map_flag_t value which specifies whether mapping is for user memory or DMA buffer. <i>(from March 2023)</i>
fd	File descriptor for dma_buf if flag is VG_LITE_MAP_DMABUF. Otherwise this parameter is ignored. <i>(from March 2023)</i>

5.6.5 vg_lite_unmap

Description

This function unmaps the buffer and frees any memory resources allocated by a previous call to [vg_lite_map](#).

Syntax

```
vg_lite_error_t vg_lite_unmap (
    vg_lite_buffer_t      *buffer
);
```

Parameters

*buffer	Pointer to a buffer structure that was filled in by vg_lite_map .
---------	---

Pixel Buffers

5.6.6 vg_lite_flush_mapped_buffer

Description

This function flushes the CPU cache for the mapped buffer to make sure the buffer contents are written to GPU memory.

Syntax

```
vg_lite_error_t vg_lite_flush_mapped_buffer (
    vg_lite_buffer_t *buffer
);
```

Parameters

*buffer	Pointer to a buffer structure that was filled in by vg_lite_map .
---------	---

5.6.7 vg_lite_set_CLUT

Description

This function sets the Color Lookup Table (CLUT) in context state for index color image. Once the CLUT is set (Not NULL), the image pixel color for index format image rendering is obtained from the Color Lookup Table (CLUT) according to the pixel's color index value.

Note: Available only for IP with Indexed color support.

Syntax

```
vg_lite_error_t vg_lite_set_CLUT (
    vg_lite_uint32_t count,
    vg_lite_uint32_t *colors
);
```

Parameters

count	This is the count of the colors in the color look up table. For INDEX_1, there can be up to 2 colors in the table; For INDEX_2, there can be up to 4 colors in the table; For INDEX_4, there can be up to 16 colors in the table; For INDEX_8, there can be up to 256 colors in the table.
*colors	The Color Lookup Table (CLUT) pointed by "colors" will be stored in the context and programmed to the command buffer when needed. The CLUT will not take effect until the command buffer is submitted to HW. The color is in ARGB format with A located in the upper bits. <i>Note:</i> The VGLite driver does not validate the CLUT contents from application.

Returns:

VG_LITE_SUCCESS since no checking is done.

Pixel Buffers
5.6.8 vg_lite_enable_dither**Description**

This function is used to enable the dither function. Dither is turned off by default.

Application can use VGLite API `vg_lite_query_feature(gcFEATURE_BIT_VG_DITHER)` to determine HW support for dither.

Syntax

```
vg_lite_error_t vg_lite_enable_dither (
);
```

Parameters

None

5.6.9 vg_lite_disable_dither**Description:**

This function is used to disable the dither function. Dither is turned off by default.

Syntax

```
vg_lite_error_t vg_lite_disable_dither (
);
```

Parameters:

None

5.6.10 vg_lite_set_gamma**Description**

This function sets a gamma value.

Application can use VGLite API `vg_lite_query_feature(gcFEATURE_BIT_VG_GAMMA)` to determine HW support for gamma.

Syntax

```
vg_lite_error_t vg_lite_set_gamma (
    vg_lite_gamma_conversion_t    gamma_value
);
```

Parameters

gamma_value	Sets a gamma value. See enum vg_lite_gamma_conversion_t .
-------------	---

Matrices

6 Matrices

This part of the API provides matrix controls.

Note: All the transformations in the driver/API are actually the final plane/surface coordinate system. There is no transformation of different coordinate systems with VGLite.

6.1 Matrix Control Float Parameter Type

Name	Typedef	Value
vg_lite_float_t	float	A single precision floating point number
vg_lite_pixel_matrix_t[20]	vg_lite_float_t	Pixel transform matrix m[20] which transforms each pixel as follows: $\begin{bmatrix} a' \\ r' \\ g' \\ b' \\ 1 \end{bmatrix} = \begin{bmatrix} m0 & m1 & m2 & m3 & m4 \\ m5 & m6 & m7 & m8 & m9 \\ m10 & m11 & m12 & m13 & m14 \\ m15 & m16 & m17 & m18 & m19 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} a \\ r \\ g \\ b \\ 1 \end{bmatrix}$

6.2 Matrix Control Structures

6.2.1 vg_lite_matrix_t Structure

This structure defines a 3x3 float matrix.

Used in structures: vg_lite_linear_gradient_t, vg_lite_radial_gradient_t.

Used in blit functions: vg_lite_blit, vg_lite_blit_rect.

Used in function: vg_lite_render_masklayer.

Used in draw functions: vg_lite_draw, vg_lite_draw_grad, vg_lite_draw_radial_grad, vg_lite_draw_pattern, vg_lite_identity, vg_lite_scale, vg_lite_translate.

vg_lite_matrix_t Members	Type	Description
m[3][3]	vg_lite_float_t	3x3 matrix, in [row] [column] order

6.2.2 vg_lite_pixel_channel_enable_t Structure

This structure provides enable disable flags for hardware pixel channels A,R,G,B.

Used in function: vg_lite_set_pixel_matrix_t.

vg_lite_pixel_channel_enable_t Members	Type	Description
enable_a	vg_lite_uint8_t	Enable A channel
enable_b	vg_lite_uint8_t	Enable B channel
enable_g	vg_lite_uint8_t	Enable G channel
enable_r	vg_lite_uint8_t	Enable R channel

Matrices

6.3 Matrix Control Functions

6.3.1 `vg_lite_identity`

Description

This function loads an identity matrix into a matrix variable.

Syntax

```
vg_lite_error_t vg_lite_identity (
    vg_lite_matrix_t *matrix,
);
```

Parameters

*matrix	Pointer to the vg_lite_matrix_t structure that will be loaded with an identity matrix
---------	---

6.3.2 `vg_lite_set_pixel_matrix`

Description

This function sets up a pixel transform matrix `m[20]` which transforms each pixel as follows:

$$\begin{bmatrix} |a'| \\ |r'| \\ |g'| \\ |b'| \\ |1| \end{bmatrix} = \begin{bmatrix} |m0 & m1 & m2 & m3 & m4| \\ |m5 & m6 & m7 & m8 & m9| \\ |m10 & m11 & m12 & m13 & m14| \\ |m15 & m16 & m17 & m18 & m19| \\ |0 & 0 & 0 & 0 & 1| \end{bmatrix} \cdot \begin{bmatrix} |a| \\ |r| \\ |g| \\ |b| \\ |1| \end{bmatrix}$$

The pixel transform for the A, R, G, B channels can be enabled/disabled individually with the channel parameter.

Applications can use VGLite API `vg_lite_query_feature(gcFEATURE_BIT_VG_PIXEL_MATRIX)` to determine HW support for gaussian blur.

Syntax

```
vg_lite_error_t vg_lite_set_pixel_matrix (
    vg_lite_pixel_matrix_t matrix,
    vg_lite_pixel_channel_enable_t *channel
);
```

Parameters

matrix	Specifies the vg_lite_pixel_matrix_t pixel transform matrix that will be loaded
*channel	Pointer to the vg_lite_pixel_channel_enable_t structure used to enable/disable individual channels.

Matrices

6.3.3 vg_lite_rotate

Description

This function rotates a matrix a specified number of degrees.

Syntax

```
vg_lite_error_t vg_lite_rotate (
    vg_lite_float_t      degrees,
    vg_lite_matrix_t     *matrix
);
```

Parameters

degrees	Number of degrees to rotate the matrix. Positive numbers rotate clockwise. The coordinates for the transformation are given in the surface coordinate system (top-to-bottom orientation). Rotations with positive angles are in the clockwise direction
*matrix	Pointer to the vg_lite_matrix_t structure that will be rotated.

6.3.4 vg_lite_scale

Description

This function scales a matrix in both horizontal and vertical directions.

Syntax

```
vg_lite_error_t vg_lite_scale (
    vg_lite_float_t      scale_x,
    vg_lite_float_t      scale_y,
    vg_lite_matrix_t     *matrix
);
```

Parameters

scale_x	Horizontal scale.
scale_y	Vertical scale.
*matrix	Pointer to the vg_lite_matrix_t structure that will be scaled.

Matrices

6.3.5 `vg_lite_translate`

Description

This function translates a matrix to a new location.

Syntax

```
vg_lite_error_t vg_lite_translate (  
    vg_lite_float_t      x,  
    vg_lite_float_t      y,  
    vg_lite_matrix_t      *matrix  
);
```

Parameters

x	X location of the transformation.
y	Y location of the transformation.
*matrix	Pointer to the vg_lite_matrix_t structure that will be translated.

Blits for Compositing and Blending

7 Blits for Compositing and Blending

This part of the API performs the hardware accelerated blit operations.

Compositing rules describes how two areas are combined to form a single area. Blending rules describes how combining the colors of the overlapping areas are combined. VGLite supports two blending operations and a subset of the Porter-Duff operations [PD84]. The Porter-Duff operators assume the pixels have the alpha associated (pre-multiplied), i.e., pixels are premultiplied prior to the blending operation. Note that GC555, GC355 and some GCNanoUltraV hardware supports alpha premultiply for RGB image, but GCNanoLiteV does not.

The source image is copied to the destination window with a specified matrix that can include translation, rotation, scaling, and perspective correction.

- The blit function can be used with or without the blend mode.
- The blit function can be used with or without specifying any color value.
- The blit function can be used for color conversion with an identity matrix and appropriate formats specified for the source and the destination buffers. In this case do not specify blend mode and color value.

7.1 BLIT Enumerations

7.1.1 vg_lite_blend_t Enumeration

This enumeration defines the blending modes supported by some VGLite API functions. S and D represent source and destination color channels. Sa and Da represent the source and destination alpha channels.

Reference: Thomas Porter and Tom Duff. Compositing digital images. *SIGGRAPH Comput. Graph.*, 18(3):253–259, January 1984.

Table 3 Porter Duff Operators and Related vg_lite_blend_t enum Values

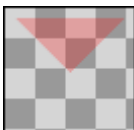

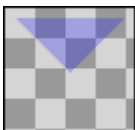

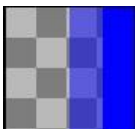

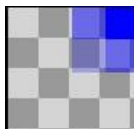

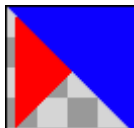

Sf/Df	0	1	Sa	1 - Sa
0	clear (n/a)	dst (n/a)	dst-in VG_LITE_BLEND_DST_IN	dst-out VG_LITE_BLEND_SUBTRACT

Blits for Compositing and Blending

vg_lite_blend_t String Values	Description
VG_LITE_BLEND_PREMULTIPLY_SRC_OVER	$S * Sa + (1 - Sa) * D$. Non-premultiplied, Not a standard OVG blend mode, only supported with GCNanoUltraV <i>(from March 2023)</i>
OpenVG Porter-Duff String Values	<i>(from Aug 2023)</i>
OPENVG_BLEND_SRC	Copy SRC , no blend, premultiplied.
OPENVG_BLEND_SRC_OVER	Porter-Duff SRC_OVER. Blend, premultiplied <i>(from Aug 2023)</i>
OPENVG_BLEND_DST_OVER	Porter-Duff DST_OVER. Blend, premultiplied <i>(from Aug 2023)</i>
OPENVG_BLEND_SRC_IN	Porter-Duff SRC_IN. Blend, premultiplied <i>(from Aug 2023)</i>
OPENVG_BLEND_DST_IN	Porter-Duff DST_IN. Blend, premultiplied <i>(from Aug 2023)</i>
OPENVG_BLEND_MULTIPLY	Porter-Duff MULTIPLY. Blend, premultiplied <i>(from Aug 2023)</i>
OPENVG_BLEND_SCREEN	Porter-Duff SCREEN. Blend, premultiplied <i>(from Aug 2023)</i>
OPENVG_BLEND_DARKEN	Porter-Duff DARKEN. Blend, premultiplied <i>(from Aug 2023)</i>
OPENVG_BLEND_LIGHTEN	Porter-Duff LIGHTEN. Blend, premultiplied <i>(from Aug 2023)</i>
OPENVG_BLEND_ADDITIVE	Porter-Duff ADDITIVE. Blend, premultiplied <i>(from Aug 2023)</i>

7.1.2 vg_lite_color_t Parameter

The common parameter `vg_lite_color_t` is described in Section 1.4. [LINK to Common Parameter Types](#).

7.1.3 vg_lite_color_transform_t Structure

Specifies the pixel color_transform values for scale and bias.

Used in functions: `vg_lite_set_color_transform`.

vg_lite_color_transform_t Members	Type	Description
<code>a_scale</code>	<code>vg_lite_float_t</code>	Scale value for alpha.
<code>a_bias</code>	<code>vg_lite_float_t</code>	Bias value for alpha.
<code>r_scale</code>	<code>vg_lite_float_t</code>	Scale value for red.
<code>r_bias</code>	<code>vg_lite_float_t</code>	Bias value for red.
<code>g_scale</code>	<code>vg_lite_float_t</code>	Scale value for green.
<code>g_bias</code>	<code>vg_lite_float_t</code>	Bias value for green.
<code>b_scale</code>	<code>vg_lite_float_t</code>	Scale value for blue.
<code>b_bias</code>	<code>vg_lite_float_t</code>	Bias value for blue.

Blits for Compositing and Blending

7.1.4 vg_lite_filter_t Enumeration

Specifies the sample filtering mode in VGLite blit and draw APIs.

Used in blit functions: `vg_lite_blit`, `vg_lite_blit_rect`,

Used in draw functions: `vg_lite_draw_radial_grad`, `vg_lite_draw_pattern`.

vg_lite_filter_t String Values	Description
VG_LITE_FILTER_POINT	Fetch only the nearest image pixel.
VG_LITE_FILTER_LINEAR	Use linear interpolation along horizontal line.
VG_LITE_FILTER_BI_LINEAR	Use a 2x2 box around the image pixel and perform an interpolation.
VG_LITE_FILTER_GAUSSIAN	Perform 3x3 gaussian blur with the convolution for image pixel. <i>(from March 2023)</i>

7.1.5 vg_lite_global_alpha_t Enumeration

Specifies the global alpha mode in VGLite blit APIs.

Used in blit function: `vg_lite_dest_global_alpha`.

vg_lite_global_alpha_t String Values	Description
VG_LITE_NORMAL	= 0: Use original src/dst alpha value.
VG_LITE_GLOBAL	Use global src/dst alpha value to replace original src/dst alpha value.
VG_LITE_SCALED	Multiply global src/dst alpha value and original src/dst alpha value.

7.1.6 vg_lite_mask_operation_t Enumeration

Specifies the mask operation mode in VGLite blit APIs.

Used in functions: `vg_lite_blend_masklayer`, `vg_lite_render_masklayer`.

vg_lite_mask_operation_t String Values	Description
VG_LITE_CLEAR_MASK	This operation sets all mask values in the region of interest to 0, ignoring the new mask layer.
VG_LITE_FILL_MASK	This operation sets all mask values in the region of interest to 1, ignoring the new mask layer.
VG_LITE_SET_MASK	This operation copies values in the region of interest from the new mask layer, overwriting the previous mask values.
VG_LITE_UNION_MASK	This operation replaces the previous mask in the region of interest by its union with the new mask layer. The resulting values are always greater than or equal to their previous value.
VG_LITE_INTERSECT_MASK	This operation replaces the previous mask in the region of interest by its intersection with the new mask layer. The resulting mask values are always less than or equal to their previous value.
VG_LITE_SUBTRACT_MASK	This operation subtracts the new mask from the previous mask and replaces the previous mask in the region of interest by the resulting

Blits for Compositing and Blending

vg_lite_mask_operation_t String Values	Description
	mask. The resulting values are always less than or equal to their previous value.

7.1.7 vg_lite_orientation_t Enumeration

Specifies the mirror orientation in VGLite blit APIs.

Used in functions: `vg_lite_set_mirror`.

vg_lite_orientation_t String Values	Description
VG_LITE_ORIENTATION_TOP_BOTTOM	Target output orientation is from top to bottom (default).
VG_LITE_ORIENTATION_BOTTOM_TOP	Target output orientation is from bottom to top.

7.1.8 vg_lite_param_type_t Enumeration

Specifies the parameter type in VGLite blit APIs.

Used in functions: `vg_lite_get_parameter`.

vg_lite_param_type_t String Values	Description
VG_LITE_SCISSOR_RECT	Count must be 4n for x, y, right, bottom

7.2 BLIT Structures

7.2.1 vg_lite_buffer_t Structure

Defined under Pixel Buffer Structures. [LINK to vg_lite_buffer_t structure](#).

7.2.2 vg_lite_color_key_t Structure

A “color key” have two sections, where each section contains R,G,B channels which are noted as `high_rgb` and `low_rgb` respectively. *(from April 2022)*

When the enable value is true, the color key specified is effective and the alpha value is used to replace the alpha channel of the destination pixel when its RGB channels are in range [`low_rgb`, `high_rgb`]. After the color key is used in the current frame, if the color key is not needed for the next frame, it should be disabled before the next frame.

Used in structure: `vg_lite_color_key4_t`.

vg_lite_color_key_t Members	Type	Description
enable	<code>vg_lite_uint8_t</code>	When set (true), this color key is enabled.
low_r	<code>vg_lite_uint8_t</code>	The R channel of <code>low_rgb</code> .
low_g	<code>vg_lite_uint8_t</code>	The G channel of <code>low_rgb</code> .
low_b	<code>vg_lite_uint8_t</code>	The B channel of <code>low_rgb</code> .
alpha	<code>vg_lite_uint8_t</code>	The alpha channel to replace the destination pixel alpha channel.
high_r	<code>vg_lite_uint8_t</code>	The R channel of <code>high_rgb</code> .

Blits for Compositing and Blending

vg_lite_color_key_t Members	Type	Description
high_g	vg_lite_uint8_t	The G channel of high_rgb.
high_b	vg_lite_uint8_t	The B channel of high_rgb.

7.2.3 vg_lite_color_key4_t Structure

The priority order is: color_key_0 > color_key_1 > color_key_2 > color_key_3. *(from April 2022)*

Used in blit function: vg_lite_set_color_key

vg_lite_color_key4_t Members	Type	Description
color_key_0		high_rgb_0, low_rgb_0, alpha_0, enable_0
color_key_1		high_rgb_1, low_rgb_1, alpha_1, enable_1
color_key_2		high_rgb_2, low_rgb_2, alpha_2, enable_2
color_key_3		high_rgb_3, low_rgb_3, alpha_3, enable_3

7.2.4 vg_lite_matrix_t Structure

Defined under Matrix Control Structures [LINK to vg_lite_matrix_t structure.](#)

7.2.5 vg_lite_path_t Structure

Defined under Vector Path Structures. [LINK to vg_lite_path_t structure.](#)

7.2.6 vg_lite_rectangle_t Structure

This structure defines the organization of a rectangle of VGLite data.

Used in blit function: vg_lite_clear.

vg_lite_rectangle_t Members	Type	Description
x	vg_lite_int32_t	X Origin of rectangle, left coordinate in pixels
y	vg_lite_int32_t	Y Origin of rectangle, top coordinate in pixels
width	vg_lite_int32_t	X Width of rectangle in pixels
height	vg_lite_int32_t	Y Height of rectangle in pixels

7.2.7 vg_lite_point_t Structure

This structure defines a 2D Point. *(from March 2021)*

Used in structure: vg_lite_point4_t.

vg_lite_point_t Members	Type	Description
x	vg_lite_int32_t	X value of coordinate
y	vg_lite_int32_t	Y value of coordinate

Blits for Compositing and Blending

7.2.8 `vg_lite_point4_t` Structure

This structure defines four 2D points that form a polygon. The points are defined by structure `vg_lite_point_t`.
(from March 2021)

Used in blit function: `vg_lite_get_transform_matrix`.

<code>vg_lite_point4_t</code> Members	Type	Description
<code>vg_lite_point[4]</code>	<code>vg_lite_int32_t</code> each	a set of four points

7.3 BLIT Functions

7.3.1 `vg_lite_blit`

Description

This is the blit function. The blit operation is performed using a source and a destination buffer. The source and destination buffer structures are defined using the `vg_lite_buffer_t` structure. Blit copies a source image to the destination window with a specified matrix that can include translation, rotation, scaling, and perspective correction. Note that `vg_lite_buffer_t` does not support coverage sample anti-aliasing so the destination buffer edge may not be smooth especially with a rotation matrix. VGLite path rendering can be used to achieve high quality coverage sample anti-aliasing (16X, 8X, 4X) rendering effect.

Note:

- The blit function can be used with or without the blend function (`vg_lite_blend_t`).
- The blit function can be used with or without specifying any color value (`vg_lite_color_t`).
- The blit function can be used for color conversion with an identity matrix and appropriate formats specified for the source and the destination buffers. In this case do not specify blend mode and color value.

Syntax

```
vg_lite_error_t vg_lite_blit (
    vg_lite_buffer_t      *target,
    vg_lite_buffer_t      *source,
    vg_lite_matrix_t      *matrix,
    vg_lite_blend_t       blend,
    vg_lite_color_t       color,
    vg_lite_filter_t      filter
);
```

Parameters

*target	Points to the <code>vg_lite_buffer_t</code> structure which defines the destination buffer. See Image Source Alignment Requirement for valid destination color formats for the blit functions.
*source	Points to the <code>vg_lite_buffer_t</code> structure for the source buffer. All color formats available in the <code>vg_lite_buffer_format_t</code> enum are valid source formats for the blit function.
*matrix	Points to a <code>vg_lite_matrix_t</code> structure that defines the 3x3 transformation matrix of source pixels into the target. If matrix is NULL, an identity matrix is assumed, meaning the source will be copied directly on the target at (0,0) location.

Blits for Compositing and Blending

blend	<p>Specifies one of the enum vg_lite_blend_t values for hardware supported blend modes to be applied to each image pixel. If no blending is required, set this value to VG_LITE_BLEND_NONE (0).</p> <p>Note: If the “matrix” parameter is specified with rotation or perspective, and the “blend” parameter is specified as VG_LITE_BLEND_NONE, VG_LITE_BLEND_SRC_IN, or VG_LITE_BLEND_DST_IN, the VGLite driver will overwrite the application’s setting for the BLIT operation as follows:</p> <p>If gcFEATURE_BIT_VG_BORDER_CULLING (vg_lite_feature_t) is supported, the transparency mode will always be set to TRANSPARENT.</p> <p>If gcFEATURE_BIT_VG_BORDER_CULLING (vg_lite_feature_t) is not supported, the blend mode will always be set to VG_LITE_BLEND_SRC_OVER.</p> <p>This is due to some limitations in the VGLite hardware.</p>
color	<p>If non-zero, this color value is used as a mix color. The mix color gets multiplied with each source pixel before blending happens. If you don't need a mix color, set the color parameter to 0.</p>
filter	<p>Specifies the filter type. All formats available in the vg_lite_filter_t enum are valid formats for this function. A value of zero (0) indicates VG_LITE_FILTER_POINT.</p>

7.3.2 [vg_lite_blit2](#)

Description

This is the blit function for use with two sources. The blit2 operation is performed using two source buffers and one destination buffer. The source and destination buffer structures are defined using the [vg_lite_buffer_t](#) structure. Source0 and Source1 are first blended according to the blend mode with a specific transformation matrix for each image. Source1 is used as the source while Source0 is used as dest and is directly output to the render target buffer.

The specified matrices can include translation, rotation, scaling, and perspective correction. Note that [vg_lite_buffer_t](#) does not support coverage sample anti-aliasing so the destination buffer edge may not be smooth especially with a rotation matrix. VGLite path rendering can be used to achieve high quality coverage sample anti-aliasing (16X, 8X, 4X) rendering effect.

Application can use VGLite API [vg_lite_query_feature](#)(gcFEATURE_BIT_VG_DOUBLE_IMAGE) to determine HW support for double image.

Note:

- The [vg_lite_blit](#) function can be used for color conversion for Source0 or Source1 before merging sources with [vg_lite_blit2](#).

Syntax

```
vg_lite_error_t vg_lite_blit2 (
    vg_lite_buffer_t      *target,
    vg_lite_buffer_t      *source0,
    vg_lite_buffer_t      *source1,
    vg_lite_matrix_t      *matrix0,
    vg_lite_matrix_t      *matrix1,
    vg_lite_blend_t       blend,
    vg_lite_filter_t       filter
);
```

Blits for Compositing and Blending

Parameters

*target	Points to the vg_lite_buffer_t structure which defines the destination buffer. See Image Source Alignment Requirement for valid destination color formats for the blit functions.
*source0, *source1	Points to the vg_lite_buffer_t structure for the source0 and source1 buffers. All color formats available in the vg_lite_buffer_format_t enum are valid source formats for the blit functions.
*matrix0, *matrix1	Points to a vg_lite_matrix_t structure that defines the 3x3 transformation matrix0 for the source0 pixels and matrix1 for the source1 pixels. If matrix0 and matrix1 are both NULL, the identity matrix is assumed, meaning the blending result of Source0 and Source1 is copied directly on the target at location(0,0).
blend	<p>Specifies one of the enum vg_lite_blend_t values for hardware supported blend modes to be applied to each image pixel. If no blending is required, set this value to VG_LITE_BLEND_NONE (0).</p> <p>Note: If the “matrix” parameter is specified with rotation or perspective, and the “blend” parameter is specified as VG_LITE_BLEND_NONE, VG_LITE_BLEND_SRC_IN, or VG_LITE_BLEND_DST_IN, the VGLite driver will overwrite the application’s setting for the BLIT operation as follows:</p> <p>If gcFEATURE_BIT_VG_BORDER_CULLING (vg_lite_feature_t) is supported, the transparency mode will always be set to TRANSPARENT.</p> <p>If gcFEATURE_BIT_VG_BORDER_CULLING (vg_lite_feature_t) is not supported, the blend mode will always be set to VG_LITE_BLEND_SRC_OVER.</p> <p>This is due to some limitations in the VGLite hardware.</p>
filter	Specifies the filter type. All formats available in the vg_lite_filter_t enum are valid formats for this function. A value of zero (0) indicates VG_LITE_FILTER_POINT.

Blits for Compositing and Blending

7.3.3 vg_lite_blit_rect

Description

This is the blit rectangle function. The blit operation is performed using a source and a destination buffer. The source and destination buffer structures are defined using the [vg_lite_buffer_t](#) structure. Blit copies a source image to the destination window with a specified matrix that can include translation, rotation, scaling, and perspective correction. Note that [vg_lite_buffer_t](#) does not support coverage sample anti-aliasing so the destination buffer edge may not be smooth especially with a rotation matrix. VGLite path rendering can be used to achieve high quality coverage sample anti-aliasing (16X, 8X, 4X) rendering effect.

Note:

- The [blit_rect](#) function can be used with or without the blend function ([vg_lite_blend_t](#)).
- The [blit_rect](#) function can be used with or without specifying any color value ([vg_lite_color_t](#)).
- The [blit_rect](#) function can be used for color conversion with an identity matrix and appropriate formats specified for the source and destination buffers. In this case do not specify blend mode and color value.
- The [vg_lite_blit_rect](#) rectangle start origin point is always (0,0) for hardware versions prior to GCNanoLiteV 1311p which do not support a non-zero rectangle origin.

Syntax

```
vg_lite_error_t vg_lite_blit_rect (
    vg_lite_buffer_t      *target,
    vg_lite_buffer_t      *source,
    vg_lite_rectangle_t    *rect,
    vg_lite_matrix_t       *matrix,
    vg_lite_blend_t        blend,
    vg_lite_color_t        color,
    vg_lite_filter_t       filter
);
```

Parameters

*target	Points to the vg_lite_buffer_t structure which defines the destination buffer. See Source Image Alignment Requirement for valid destination color formats for the blit_rect functions.
*source	Points to the vg_lite_buffer_t structure for the source buffer. All color formats available in the vg_lite_buffer_format_t enum are valid source formats for the blit_rect function.
*rect	Specifies the rectangle area (x, y, width, height) of the source image to blit. Note: Non-zero source origins are supported.
*matrix	Points to a vg_lite_matrix_t structure that defines the 3x3 transformation matrix of source pixels into the target. If matrix is NULL, an identity matrix is assumed, meaning the source will be copied directly on the target at 0,0 location.
blend	Specifies one of the enum vg_lite_blend_t values for hardware supported blend modes to be applied to each image pixel. If no blending is required, set this value to VG_LITE_BLEND_NONE (0). Note: If the “matrix” parameter is specified with rotation or perspective, and the “blend” parameter is specified as VG_LITE_BLEND_NONE, VG_LITE_BLEND_SRC_IN, or VG_LITE_BLEND_DST_IN, the VGLite driver will overwrite the application’s setting for the BLIT operation as follows:

Blits for Compositing and Blending

	<p>If <code>gcFEATURE_BIT_VG_BORDER_CULLING</code> (vg_lite_feature_t) is supported, the transparency mode will always be set to <code>TRANSPARENT</code>.</p> <p>If <code>gcFEATURE_BIT_VG_BORDER_CULLING</code> (vg_lite_feature_t) is not supported, the blend mode will always be set to <code>VG_LITE_BLEND_SRC_OVER</code>.</p> <p>This is due to some limitations in the VGLite hardware.</p>
color	If non-zero, this color value is used as a mix color. The mix color gets multiplied with each source pixel before blending happens. If you don't need a mix color, set the color parameter to 0.
filter	Specifies the filter type. All formats available in the vg_lite_filter_t enum are valid formats for this function. A value of zero (0) indicates <code>VG_LITE_FILTER_POINT</code> .

7.3.4 `vg_lite_get_transform_matrix`

Description

This function generates a 3x3 homogenous transform matrix from 4 source coordinates and 4 target coordinates. *(from March 2021)*

Syntax

```
vg_lite_error_t vg_lite_get_transform_matrix (
    vg_lite_point4_t      src,
    vg_lite_point4_t      dst,
    vg_lite_matrix_t      *mat
);
```

Parameters

src	Pointer to a set of four 2D points that form a source polygon.
dst	Pointer to a set of four 2D points that form a destination polygon.
mat	Output parameter, pointer to a 3x3 homogenous matrix that transforms the source polygon to a destination polygon.

7.3.5 `vg_lite_clear`

Description

This function performs the clear operation, clearing/filling the specified buffer (entire buffer or partial rectangle in a buffer) with an explicit color.

Syntax

```
vg_lite_error_t vg_lite_clear (
    vg_lite_buffer_t      *target,
    vg_lite_rectangle_t    *rect,
    vg_lite_color_t        color
);
```

Parameters

*target	Pointer to the vg_lite_buffer_t structure for the destination buffer. All color formats available in the vg_lite_buffer_format_t enum are valid destination formats for the clear function.
---------	---

Blits for Compositing and Blending

*rect	Pointer to a vg_lite_rectangle_t structure that specifies the area to be filled. If the rectangle is NULL, the entire target buffer will be filled with the specified color.
color	Clear color, as specified in the vg_lite_color_t enum which is the color value to use for filling the buffer. If the buffer is in L8 format, the RGBA color will be converted into a luminance value.

7.3.6 vg_lite_set_color_key

Description

This function sets a color key. Color key can be used for blit or for draw pattern operations. *(from April 2022)*

A “color key” have two sections, where each section contains R,G,B channels which are noted as high_rgb and low_rgb respectively.

When the [vg_lite_color_key_t](#) structure value enable is true, the color key specified is effective and the alpha value is used to replace the alpha channel of the destination pixel when its RGB channels are within range [low_rgb, high_rgb]. After the color key is used in the current frame, if the color key is not needed for the next frame, it should be disabled before the next frame.

Hardware support for color key is not available for GCNanoLiteV. Application can use VGLite API [vg_lite_query_feature\(gcFEATURE_BIT_VG_COLOR_KEY\)](#) to determine HW support for color key.

Syntax

```
vg_lite_error_t vg_lite_set_color_key (
    vg_lite_color_key4_t      colorkey
);
```

Parameters

colorkey	<p>A color key as defined by vg_lite_color_key4_t.</p> <p>There are 4 groups of color key states:</p> <ul style="list-style-type: none"> - color_key_0: high_rgb_0, low_rgb_0, alpha_0, enable_0. - color_key_1: high_rgb_1, low_rgb_1, alpha_1, enable_1. - color_key_2: high_rgb_2, low_rgb_2, alpha_2, enable_2. - color_key_3: high_rgb_3, low_rgb_3, alpha_3, enable_3. <p>The priority order of these states is:</p> <p>color_key_0 > color_key_1 > color_key_2 > color_key_3.</p>
----------	---

Return

VG_LITE_SUCCESS if successful. Otherwise VG_LITE_NOT_SUPPORT if color key is not supported in hardware.

Blits for Compositing and Blending

7.3.7 vg_lite_gaussian_filter

Description

This function sets 3x3 gaussian blur weighted values to filter an image pixel. *(from March 2023)*

The parameters w0, w1, w2 define a 3x3 gaussian blur weight matrix as:

```
| w2  w1  w2 |
| w1  w0  w1 |
| w2  w1  w2 |
```

The sum of the 9 kernel weights must be 1.0 to avoid convolution overflow ($w0 + 4*w1 + 4*w2 = 1.0$).

The 3x3 weight matrix applies to a 3x3 pixel block:

```
| pixel[i-1][j-1]  pixel[i][j-1]  pixel[i+1][j-1] |
| pixel[i-1][j]    pixel[i][j]    pixel[i+1][j]   |
| pixel[i-1][j+1]  pixel[i][j+1]  pixel[i+1][j+1] |
```

With the following dot product equation:

```
color[i][j] = w2*pixel[i-1][j-1] + w1*pixel[i][j-1] + w2*pixel[i+1][j-1]
              + w1*pixel[i-1][j]   + w0*pixel[i][j]   + w1*pixel[i+1][j]
              + w2*pixel[i-1][j+1] + w1*pixel[i][j+1] + w2*pixel[i+1][j+1];
```

Applications can use VGLite API `vg_lite_query_feature(gcFEATURE_BIT_VG_GAUSSIAN_BLUR)` to determine HW support for gaussian blur.

Syntax

```
vg_lite_error_t vg_lite_gaussian_filter (
    vg_lite_float_t w0
    vg_lite_float_t w1
    vg_lite_float_t w2
);
```

Parameters

w0, w1, w2	w0, w1, w2 define a 3x3 gaussian blur weighted matrix as:
	w2 w1 w2
	w1 w0 w1
	w2 w1 w2

Return

VG_LITE_SUCCESS if successful. Otherwise, VG_LITE_NOT_SUPPORT if gaussian blur is not supported in hardware.

Blits for Compositing and Blending

7.4 Blit/Draw Extended Functions

The following BLIT or DRAW related functions typically require GC355 or GC555 hardware and are not available for all Vivante Vector Graphics hardware configurations.

Applications can use VGLite API [vg_lite_query_feature](#) to determine HW support for the related functionality.

7.4.1 `vg_lite_get_parameter`

Description

This function is used to get parameters in a `params[]` array. *(from Aug 2023)*

Syntax

```
vg_lite_error_t vg_lite_get_parameter (
    vg_lite_param_type_t    type,
    vg_lite_int32_t         count,
    vg_lite_float_t         *params
);
```

Parameters

type	Parameter type as specified by vg_lite_param_type_t enum.
count	Count.
*params	Pointer to <code>params[]</code> array.

7.4.2 `vg_lite_enable_scissor`

Description

This function enables scissor rectangle operation for the rectangle regions defined by `vg_lite_scissor_rects` API. *(from March 2020, modified August 2020, requires GC355 or GC555 hardware)*

Applications can use VGLite API [vg_lite_query_feature](#)(gcFEATURE_BIT_VG_SCISSOR) to determine HW support for scissoring. Support is available with GC355 and GC555.

Syntax

```
vg_lite_error_t vg_lite_enable_scissor (
    void
);
```

Blits for Compositing and Blending

7.4.3 vg_lite_disable_scissor

Description

This function disables scissor operation for the rectangle regions defined by `vg_lite_scissor_rects` API. *(from March 2020, modified August 2020, requires GC355 or GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_disable_scissor (
    void
);
```

7.4.4 vg_lite_scissor_rects

Description

This function defines scissor rectangle regions on the hardware mask layer. But the scissor function is enable/disabled by `vg_lite_enable_scissor` and `vg_lite_disable_scissor` APIs. *(from August 2022, requires GC355 or GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_scissor_rects (
    vg_lite_uint32_t      nums,
    vg_lite_rectangle_t   rect[]
);
```

Parameters

nums	Number of scissor rectangles.
rect[]	The scissor rectangle array.

7.4.5 vg_lite_set_scissor

Description

This is a legacy scissor API function that can be used to set and enable a single scissor rectangle for the render target. This scissor API is supported by a different hardware mechanism other than the mask layer, and it is not enabled/disabled by `vg_lite_enable_scissor` and `vg_lite_disable_scissor` APIs. *(requires GC355 or GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_set_scissor (
    vg_lite_int32_t      x,
    vg_lite_int32_t      y,
    vg_lite_int32_t      right,
    vg_lite_int32_t      bottom
);
```

Parameters

x	X Origin of rectangle, left coordinate in pixels
y	Y Origin of rectangle, top coordinate in pixels

Blits for Compositing and Blending

right	X rightmost pixel of rectangle
bottom	Y bottom pixel of rectangle

7.4.6 `vg_lite_disable_color_transform`

Description

This function is used to disable color transformation. By default, color transform is turned off. *(from Sept 2022, only for GC355 and GC555 hardware)*

Applications can use VGLite API `vg_lite_query_feature(gcFEATURE_BIT_VG_COLOR_TRANSFORMATION)` to determine HW support for color transformation. Support is available with GC355 and GC555.

Syntax

```
vg_lite_error_t vg_lite_disable_color_transform (
);
```

Parameters

None

7.4.7 `vg_lite_enable_color_transform`

Description

This function is used to enable color transformation. By default, color transform is turned off. *(from Sept 2022, only for GC355 and GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_enable_color_transform (
);
```

Parameters

None

7.4.8 `vg_lite_set_color_transform`

Description

This function is used to set pixel scale and bias values for color transformation for each pixel channel. *(from August 2022, only for GC355 and GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_set_color_transform (
    vg_lite_color_transform_t *values
);
```

Parameters

*values	Pointer to the color transformation values to set. See enum vg_lite_color_transform_t .
---------	---

Blits for Compositing and Blending

7.4.9 `vg_lite_enable_masklayer`

Description

This function controls the availability of mask functionality. Mask is turned off by default. *(from August -Sept 2022, requires GC555 hardware)*

Applications can use VGLite API `vg_lite_query_feature`(gcFEATURE_BIT_VG_MASK) to determine HW support for mask. The blit and draw mask functions below require GC555 hardware support. These functions were introduced in August 2022 and syntax or name further refined in September 2022.

Syntax

```
vg_lite_error_t vg_lite_enable_masklayer (
    void
);
```

7.4.10 `vg_lite_disable_masklayer`

Description

This function controls the availability of mask functionality. Mask is turned off by default. *(from August -Sept 2022, requires GC555 hardware, prior to Sept 2022 name was `vg_lite_disable_mask_layer`)*

Syntax

```
vg_lite_error_t vg_lite_disable_masklayer (
    void
);
```

7.4.11 `vg_lite_create_masklayer`

Description

This function creates a mask layer with the specified width and height. The mask format defaults to A8 and the default mask value is 255. *(from August 2022-Sept, requires GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_create_masklayer (
    vg_lite_buffer_t          *masklayer,
    vg_lite_uint32_t          width,
    vg_lite_uint32_t          height
);
```

Parameters

*masklayer	Points to the address of the buffer of the mask layer to be created.
width	Mask layer width (in pixels).
height	Mask layer height (in pixels).

Blits for Compositing and Blending

7.4.12 `vg_lite_fill_masklayer`

Description

This function sets the values of a given mask layer within a given rectangular region to a given value. The value must be between 0 and 255. *(from August-Sept 2022, requires GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_fill_masklayer (
    vg_lite_buffer_t          *masklayer,
    vg_lite_rectangle_t       *rect,
    vg_lite_uint8_t           value
);
```

Parameters

*masklayer	Points to the address of the buffer of the mask layer to be filled.
*rect	The rectangle area (x, y, width, height) to be filled with value.
value	The value of the fill area. The value must be between 0 and 255.

7.4.13 `vg_lite_blend_masklayer`

Description

This function blends the specified area of the source mask layer with the destination mask layer according to an `vg_lite_mask_operation_t` enumeration value, to create a blended destination mask layer. *(from August-Sept 2022, requires GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_blend_masklayer (
    vg_lite_buffer_t          *dst_masklayer,
    vg_lite_buffer_t          *src_masklayer,
    vg_lite_mask_operation     operation,
    vg_lite_rectangle_t       *rect,
);
```

Parameters

*dst_masklayer	Points to the address of the buffer of the destination mask layer.
*src_masklayer	Points to the address of the buffer of the source mask layer.
operation	Blending mode to be applied to each image pixel, as defined by enum vg_lite_mask_operation_t .
*rect	The rectangle area (x, y, width, height) of the blend operation.

Blits for Compositing and Blending

7.4.14 vg_lite_set_masklayer

Description:

This function sets the given mask layer to the hardware. *(from August-Sept 2022, requires GC555 hardware)*

Syntax:

```
vg_lite_error_t vg_lite_set_masklayer (
    vg_lite_buffer_t          *masklayer
);
```

Parameters

*masklayer	Points to the address of the buffer of the mask layer to be set.
------------	--

7.4.15 vg_lite_render_masklayer

Description

This function draws the mask layer according to the specified path, color and matrix information. *(from August-Sept 2022, requires GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_render_masklayer (
    vg_lite_buffer_t          *masklayer,
    vg_lite_mask_operation    operation,
    vg_lite_path_t            *path,
    vg_lite_fill_t            fill_rule,
    vg_lite_color_t           color,
    vg_lite_matrix_t          *matrix
);
```

Parameters

*masklayer	Points to the address of the buffer of the destination mask layer.
operation	Blending mode to be applied to each image pixel, as defined by enum vg_lite_mask_operation_t .
*path	Pointer to the vg_lite_path_t structure containing path data which describes the path to draw. Refer to the section on Vector Path Data Opcodes in this document for opcode detail.
fill_rule	Specifies the vg_lite_fill_t enum value for the fill rule for the path.
color	Specifies the color vg_lite_color_t RGBA value to be applied to each pixel drawn by the path.
*matrix	Points to a vg_lite_matrix_t structure that defines the 3x3 transformation matrix of the path. If matrix is NULL, an identity matrix is assumed, meaning the source will be copied directly on the target at 0,0 location. which is usually a bad idea since the path can be anything.

Blits for Compositing and Blending

7.4.16 `vg_lite_destroy_masklayer`

Description

This function is used to free a mask layer. *(from August-Sept 2022, requires GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_destroy_masklayer (
    vg_lite_buffer_t          masklayer
);
```

Parameters

*masklayer	Points to the address of the buffer of the mask layer to be destroyed.
------------	--

7.4.17 `vg_lite_set_mirror`

Description

This function is used to control mirror functionality. By default, mirror is turned off and the default output orientation is from top to bottom. *(from August 2022, only for GC555 hardware)*

Application can use VGLite API [vg_lite_query_feature](#)(gcFEATURE_BIT_VG_MIRROR) to determine HW support for mirror. Mirror functions require GC555 hardware.

Syntax

```
vg_lite_error_t vg_lite_set_mirror (
    vg_lite_orientation_t    orientation
);
```

Parameters

orientation	The orientation mode as defined by enum vg_lite_orientation_t .
-------------	---

Returns

VG_LITE_SUCCESS or VG_LITE_NOT_SUPPORT if not supported.

Blits for Compositing and Blending

7.4.18 `vg_lite_source_global_alpha`

Description

This function will set image/source global alpha and return a status error code. *(from June 2021, requires GCNanoUltraV or GC555 hardware)*

Application can use VGLite API `vg_lite_query_feature`(gcFEATURE_BIT_VG_GLOBAL_ALPHA) to determine HW support for global alpha. The global alpha BLIT related functions require GCNanoUltraV or GC555 hardware.

Syntax

```
vg_lite_error_t vg_lite_source_global_alpha (
    vg_lite_global_alpha_t      alpha_mode,
    vg_lite_uint8_t             alpha_value
);
```

Parameters

alpha_mode	Global alpha mode value. See enum vg_lite_global_alpha_t .
alpha_value	The image/source global alpha value to set.

Returns

VG_LITE_SUCCESS or VG_LITE_NOT_SUPPORT if global alpha is not supported.

7.4.19 `vg_lite_dest_global_alpha`

Description

This function will set destination global alpha and return a status error code. *(from June 2021, requires GCNanoUltraV or GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_dest_global_alpha (
    vg_lite_global_alpha_t      alpha_mode,
    vg_lite_uint8_t             alpha_value
);
```

Parameters

alpha_mode	Global alpha mode value. See enum vg_lite_global_alpha_t .
alpha_value	The destination global alpha value to set.

Returns

VG_LITE_SUCCESS or VG_LITE_NOT_SUPPORT if global alpha is not supported.

Vector Path Control

8 Vector Path Control

8.1 Vector Path Enumerations

8.1.1 `vg_lite_format_t` Enumeration

Values for `vg_lite_format_t` are defined in the table Common Parameter Types. [LINK to Common Parameters table.](#)

If <code>vg_lite_format_t</code>	Path data alignment in array should be:
<code>VG_LITE_S8</code>	8 bit
<code>VG_LITE_S16</code>	2 bytes
<code>VG_LITE_S32</code>	4 bytes

8.1.2 `vg_lite_quality_t` Enumeration

Specifies the level of hardware assisted anti-aliasing.

Used in structure: `vg_lite_path_t`.

Used in functions: `vg_lite_init_path`, `vg_lite_init_arc_path`.

<code>vg_lite_quality_t</code> String Values	Description
<code>VG_LITE_HIGH</code>	High quality: 16x coverage sample anti-aliasing
<code>VG_LITE_UPPER</code>	Upper quality: 8x coverage sample anti-aliasing. Use <code>vg_lite_query_feature</code> to determine availability of 8x CSAA (feature enum value <code>gcFEATURE_BIT_VG_QUALITY_8X</code> . (deprecated from June 2020, available with supported hardware from August 2022)
<code>VG_LITE_MEDIUM</code>	Medium quality: 4x coverage sample anti-aliasing
<code>VG_LITE_LOW</code>	Low quality: no anti-aliasing

8.2 Vector Path Structures

8.2.1 `vg_lite_hw_memory` Structure

This structure simply records the memory allocation info by kernel.

Used in structure: `vg_lite_path_t`.

<code>vg_lite_hw_memory_t</code> Members	Type	Description
<code>handle</code>	<code>vg_lite_pointer</code>	GPU memory object handle
<code>memory</code>	<code>vg_lite_pointer</code>	Logical memory address
<code>address</code>	<code>vg_lite_uint32_t</code>	GPU memory address
<code>bytes</code>	<code>vg_lite_uint32_t</code>	Size of memory
<code>property</code>	<code>vg_lite_uint32_t</code>	Bit 0 is used for path upload: 0: Disable path data uploading (always embedded into command buffer). 1: Enable auto path data uploading.

Vector Path Control

8.2.2 vg_lite_path_t Structure

This structure describes VGLite path data.

Path data is composed of op codes and coordinates. The format for op codes is always VG_LITE_S8. Refer to the section on Vector Path Data Opcodes in this document for opcode detail.

- Used in init functions: `vg_lite_init_path`, `vg_lite_init_arc_path`, `vg_lite_upload_path`, `vg_lite_clear_path`, `vg_lite_append_path`.
- Used in function: `vg_lite_render_masklayer`.
- Used in draw functions: `vg_lite_draw`, `vg_lite_draw_grad`, `vg_lite_draw_radial_grad`, `vg_lite_draw_pattern`.

vg_lite_path_t Members	Type	Description	
bounding_box[4]	vg_lite_float_t	bounding box for path [0] left [1] top [2] right [3] bottom	
quality	vg_lite_quality_t	enum for quality hint for the path, anti-aliasing level	
format	vg_lite_format_t	enum for coordinate format. The coordinates may have these formats:	
		If vg_lite_format_t	Path data alignment in array should be
		VG_LITE_S8	8 bit
		VG_LITE_S16	2 bytes
		VG_LITE_S32	4 bytes
uploaded	vg_lite_hw_memory_t	struct with path data that has been uploaded into GPU addressable memory	
path_length	vg_lite_uint32_t	number of bytes in the path data	
path	vg_lite_pointer	pointer to the physical description of the path	
path_changed	vg_lite_int8_t	0: not changed; 1: changed.	
pdata_internal	vg_lite_int8_t	0: path data memory is allocated by application; 1: path data memory is allocated by driver.	
path_type	vg_lite_path_type_t	The draw path type as specified in enum vg_lite_path_type_t . <i>(added for stroke control, from March 2022)</i>	
*stroke	vg_lite_stroke_t	As defined by structure vg_lite_stroke_t <i>(added for stroke control, from March 2022)</i>	
stroke_path	vg_lite_pointer	Pointer to the physical description of the stroke path. <i>(added for stroke control, from March 2022)</i>	
stroke_size	vg_lite_uint32_t	Number of bytes in the stroke path data. <i>(added for stroke control, from March 2022)</i>	
stroke_color	vg_lite_color_t	The stroke path fill color. <i>(from Sept 2022)</i>	
add_end	vg_lite_int8_t	Flag that add end_path in driver <i>(from March 2023)</i>	

Vector Path Control

Special Notes for Path Objects:

- Endianness has no impact, as it is aligned against the boundaries.
- Multiple contiguous op codes should be packed by the size of the specified data format. E.g., by 2 bytes for VG_LITE_S16 or by 4 bytes for VG_LITE_S32.
 - For example, since opcodes are 8-bits (1 byte), for 16-bit (2 byte) or 32-bit (4 byte) data types:

```
...
<opcode1_that_needs_data>
<align_to_data_size>
<data_for_opcode1>
<opcode2_that_doesnt_need_data>
<opcode3_that_needs_data>
<align_to_data_size>
<data_for_opcode3>
...
```

- Path data in the array should always be 1-, 2, or 4-byte aligned, depending on the format:
 - For example, for 32-bit (4 byte) data types:

```
...
<opcode1_that_needs_data>
<pad to 4 bytes>
<4 byte data_for_opcode1>
<opcode2_that_doesnt_need_data>
<opcode3_that_needs_data>
<pad to 4 bytes>
<4 byte data_for_opcode3>
...
```

8.3 Vector Path Functions

When using a small tessellation window and depending on a path's size, a path might be uploaded to the hardware multiple times because the hardware scanline convert path with the provided tessellation window size, so VGLite path rendering performance might go down. So it is better to set the tessellation buffer size to the most common path size, for example if you only render 24-pt fonts, you can set the tessellation buffer to be 24x24.

All the RGBA color formats available in the [vg_lite_buffer_format_t](#) are supported as the destination buffer for the draw function.

Vector Path Control

8.3.1 vg_lite_get_path_length

Description

This function calculates the path command buffer length (in bytes).

The application is responsible for allocating a buffer according to the buffer length calculated with this function. Then the buffer is used by the path as a command buffer. The VGLite driver does not allocate the path command buffer.

Syntax

```
vg_lite_uint32_t vg_lite_get_path_length (
    vg_lite_uint8_t          *opcode,
    vg_lite_uint32_t         count,
    vg_lite_format_t         format
);
```

Parameters

*opcode	Pointer to the opcode array to use to construct the path. (<i>*opcode from March 2023</i>)
count	The opcode count.
format	The coordinate data format. All formats available for vg_lite_format_t are valid formats for this function.

8.3.2 vg_lite_append_path

Description:

This function assembles the command buffer for the path. The command buffer is allocated by the application and assigned to the path. This function makes the final GPU command buffer for the path based on the input opcodes (cmd) and coordinates (data). Note that the application is responsible to allocate a buffer large enough for the path. (*from Jan 2022, returns a vg_lite_error_t status code*)

Syntax

```
vg_lite_error_t vg_lite_append_path (
    vg_lite_path_t          *path
    vg_lite_uint8_t          *opcode,
    vg_lite_pointer         data,
    vg_lite_uint32_t         seg_count
);
```

Parameters

*path	Pointer to the vg_lite_path_t structure with the path definition.
*opcode	Pointer to the opcode array to use to construct the path. (<i>*opcode from March 2023</i>)
data	Pointer to the coordinate data array to use to construct the path.
seg_count	The opcode count.

Vector Path Control

Returns

Returns VG_LITE_SUCCESS if successful. See [vg_lite_error_t](#) enum for other return codes.

8.3.3 vg_lite_init_path

Description

This function initializes a path definition with specified values. *(From Dec 2019 returns [vg_lite_error_t](#), previous was void.)*

Syntax

```
vg_lite_error_t vg_lite_init_path (
    vg_lite_path_t          *path,
    vg_lite_format_t        format,
    vg_lite_quality_t        quality,
    vg_lite_uint32_t        length,
    vg_lite_pointer          *data,
    vg_lite_float_t         min_x,
    vg_lite_float_t         min_y,
    vg_lite_float_t         max_x,
    vg_lite_float_t         max_y
);
```

Parameters:

*path	Pointer to the vg_lite_path_t structure for the path object to be initialized with the member values specified.
format	The coordinate data format. All formats available in the vg_lite_format_t enum are valid formats for this function.
quality	The quality for the path object. All formats available in the vg_lite_quality_t enum are valid formats for this function.
length	The length of the path data (in bytes).
*data	Pointer to path data.
min_x min_y max_x max_y	Minimum and maximum x and y values specifying the bounding box of the path.

Returns

Returns VG_LITE_SUCCESS if successful. See [vg_lite_error_t](#) enum for other return codes.

Vector Path Control

8.3.4 vg_lite_init_arc_path

Description:

This function initializes an arc path definition with specified values. *(from February 2021)*

Syntax:

```
vg_lite_error_t vg_lite_init_arc_path (
    vg_lite_path_t          *path,
    vg_lite_format_t        format,
    vg_lite_quality_t       quality,
    vg_lite_uint32_t        length,
    vg_lite_pointer         *data,
    vg_lite_float_t         min_x,
    vg_lite_float_t         min_y,
    vg_lite_float_t         max_x,
    vg_lite_float_t         max_y
);
```

Parameters:

*path	Pointer to the <code>vg_lite_path_t</code> structure for the path object to be initialized with the member values specified.
format	The coordinate data format. The <code>vg_lite_format_t</code> enum value should be FP32.
quality	The quality for the path object. All formats available in the <code>vg_lite_quality_t</code> enum are valid formats for this function.
length	The length of the path data (in bytes).
*data	Pointer to path data.
min_x min_y max_x max_y	Minimum and maximum x and y values specifying the bounding box of the path.

Returns:

Returns `VG_LITE_SUCCESS` if successful. See [vg_lite_error_t](#) enum for other return codes.

Vector Path Control
8.3.5 vg_lite_upload_path**Description**

This function is used to upload a path to GPU memory.

In normal cases, the VGLite driver will copy any path data into a command buffer structure during runtime. This does take some time if there are many paths to be rendered. Also, in an embedded system the path data won't change - so it makes sense to upload the path data into GPU memory in such a form that the GPU can directly access it. This function will signal the driver to allocate a buffer that will contain the path data and the required command buffer header and footer data for the GPU to access the data directly. Call `vg_lite_clear_path` to free this buffer after the path is used.

Syntax

```
vg_lite_error_t vg_lite_upload_path (
    vg_lite_path_t      *path
);
```

Parameters

*path	Pointer to a vg_lite_path_t structure that contains the path to be uploaded.
--------------	--

Returns

VG_LITE_OUT_OF_MEMORY if not enough GPU memory is available for buffer allocation.

8.3.6 vg_lite_clear_path**Description:**

This function will clear and reset path member values. If the path has been uploaded, it frees the GPU memory allocated when uploading the path. *(From Dec 2019 returns `vg_lite_error_t`, previous was void.)*

Syntax:

```
Vg_lite_error_t vg_lite_clear_path (
    vg_lite_path_t      *path
);
```

Parameters:

*path	Pointer to the vg_lite_path_t path definition to be cleared.
--------------	--

Returns:

Returns VG_LITE_SUCCESS if successful. See [vg_lite_error_t](#) enum for other return codes.

Vector Path Control

8.4 Vector Path Opcodes for Plotting Paths

The following opcodes are path drawing commands available for vector path data.

A Path operation is submitted to the GPU as [Opcode | Coordinates]. The Operation code is stored as a VG_LITE_S8 while the Coordinates are specified via vg_lite_format_t.

Table 4 Vector Path Data Opcodes

Opcode	Arguments	Description
0x00	None	END. Finish tessellation. Close any open path.
0x02	(x, y)	MOVE. Move to the given vertex. Close any open path. $start_x = x$ $start_y = y$
0x03	(Δx , Δy)	MOVE_REL. Move to the given relative point. Close any open path. $start_x = start_x + \Delta x$ $start_y = start_y + \Delta y$
0x04	(x, y)	LINE. Draw a line to the given point. $Line(start_x, start_y, x, y)$ $start_x = x$ $start_y = y$
0x05	(Δx , Δy)	LINE_REL. Draw a line to the given relative point. $x = start_x + \Delta x$ $y = start_y + \Delta y$ $Line(start_x, start_y, x, y)$ $start_x = x$ $start_y = y$
0x06	(cx, cy) (x, y)	QUAD. Draw a quadratic curve to the given end point using the specified control point. $Quad(start_x, start_y, cx, cy, x, y)$ $start_x = x$ $start_y = y$
0x07	(Δcx , Δcy) (Δx , Δy)	QUAD_REL. Draw a quadratic curve to the given relative end point using the specified relative control point. $cx = start_x + \Delta cx$ $cy = start_y + \Delta cy$ $x = start_x + \Delta x$ $y = start_y + \Delta y$ $Quad(start_x, start_y, cx, cy, x, y)$ $start_x = x$ $start_y = y$
0x08	(cx1, cy1) (cx2, cy2) (x, y)	CUBIC. Draw a cubic curve to the given end point using the specified control points. $Cubic(start_x, start_y, cx_1, cy_1, cx_2, cy_2, x, y)$ $start_x = x$

Vector Path Control

Opcode	Arguments	Description
		$start_y = y$
0x09	($\Delta cx1, \Delta cy1$) ($\Delta cx2, \Delta cy2$) ($\Delta x, \Delta y$)	CUBIC_REL. Draw a cubic curve to the given relative end point using the specified relative control points. $cx_1 = start_x + \Delta cx_1$ $cy_1 = start_y + \Delta cy_1$ $cx_2 = start_x + \Delta cx_2$ $cy_2 = start_y + \Delta cy_2$ $x = start_x + \Delta x$ $y = start_y + \Delta y$ $Cubic(start_x, start_y, cx_1, cy_1, cx_2, cy_2, x, y)$ $start_x = x$ $start_y = y$

The following Opcodes for arc paths are available (from February 2021). Note: CW and CCW for clockwise and counter-clockwise.

Table 5 Vector Path Data Opcodes for Arc Paths

Opcode for Arc Paths	Arguments	Description
0x0A	(rh, rv, rot, x, y)	SCCWARC. Draw a small CCW Arc to the given end point using the specified radius and rotation angle. $SCCWARC(rh, rv, rot, x, y)$ $start_x = x$ $start_y = y$
0x0B	(rh,rv,rot,x,y)	SCCWARC_REL. Draw a small CCW Arc to the given relative end point using the specified radius and rotation angle. $x = start_x + \Delta x$ $y = start_y + \Delta y$ $SCCWARC(rh, rv, rot, x, y)$ $start_x = x$ $start_y = y$
0x0C	(rh,rv,rot,x,y)	SCWARC. Draw a small CW Arc to the given end point using the specified radius and rotation angle. $SCWARC(rh, rv, rot, x, y)$ $start_x = x$ $start_y = y$
0x0D	(rh,rv,rot,x,y)	SCWARC_REL. Draw a small CW Arc to the given relative end point using the specified radius and rotation angle. $x = start_x + \Delta x$ $y = start_y + \Delta y$ $SCWARC(rh, rv, rot, x, y)$ $start_x = x$

Vector Path Control

Opcode for Arc Paths	Arguments	Description
		$start_y = y$
0x0E	(rh,rv,rot,x,y)	<p>LCCWARC. Draw a large CCW Arc to the given end point using the specified radius and rotation angle.</p> <p>$LCCWARC(rh,rv,rot,x,y)$</p> <p>$start_x = x$</p> <p>$start_y = y$</p>
0x0F	(rh,rv,rot,x,y)	<p>LCCWARC_REL. Draw a large CCW Arc to the given relative end point using the specified radius and rotation angle.</p> <p>$x = start_x + \Delta x$</p> <p>$y = start_y + \Delta y$</p> <p>$LCCWARC(rh,rv,rot,x,y)$</p> <p>$start_x = x$</p> <p>$start_y = y$</p>
0x10	(rh,rv,rot,x,y)	<p>LCWARC. Draw a large CW Arc to the given end point using the specified radius and rotation angle.</p> <p>$LCWARC(rh,rv,rot,x,y)$</p> <p>$start_x = x$</p> <p>$start_y = y$</p>
0x11	(rh,rv,rot,x,y)	<p>LCWARC_REL. Draw a large CW Arc to the given relative end point using the specified radius and rotation angle.</p> <p>$x = start_x + \Delta x$</p> <p>$y = start_y + \Delta y$</p> <p>$LCWARC(rh,rv,rot,x,y)$</p> <p>$start_x = x$</p> <p>$start_y = y$</p>

Vector Based Draw Operations

9 Vector Based Draw Operations

This part of the API performs the hardware accelerated draw operations.

9.1 Draw and Gradient Enumerations

9.1.1 `vg_lite_blend_t` Enumeration

This enumeration is detailed under the Blit section. [LINK to `vg_lite_blend_t` enumeration.](#)

9.1.2 `vg_lite_color_t` Parameter

The common parameter `vg_lite_color_t` is described in Section 1.4 Common Parameter Types.

[LINK to `vg_lite_color_t` color parameter description.](#)

9.1.3 `vg_lite_fill_t` Enumeration

This enumeration is used to specify the fill rule to use. For drawing any path, the hardware supports both non-zero and odd-even fill rules.

To determine whether any point is contained inside an object, imagine drawing a line from that point out to infinity in any direction such that the line does not cross any vertex of the path. For each edge that is crossed by the line, add 1 to the counter if the edge is crossed from left to right, as seen by an observer walking across the line towards infinity, and subtract 1 if the edge crossed from right to left. In this way, each region of the plane will receive an integer value.

The non-zero fill rule says that a point is inside the shape if the resulting sum is not equal to zero. The even/odd rule says that a point is inside the shape if the resulting sum is odd, regardless of sign.

Used in function: `vg_lite_render_masklayer`.

Used in draw functions: `vg_lite_draw`, `vg_lite_draw_grad`, `vg_lite_draw_radial_grad`, `vg_lite_draw_pattern`.

<code>vg_lite_fill_t</code> String Values	Description
<code>VG_LITE_FILL_NON_ZERO</code>	Non-zero fill rule. A pixel is drawn if it crosses at least one path pixel.
<code>VG_LITE_FILL_EVEN_ODD</code>	Even-odd fill rule. A pixel is drawn if it crosses an odd number of path pixels.

9.1.4 `vg_lite_filter_t` Enumeration

Defined under Blit. [LINK to `vg_lite_filter_t` enumeration.](#)

9.1.5 `vg_lite_gradient_spreadmode_t` Enumeration

Defines the gradient padding mode. Matches OpenVG enum `VGColorRampSpreadMode` (*from March 2023, replaces `vg_lite_radial_gradient_spreadmode`, requires GC355 hardware*)

Used in structure: `vg_lite_radial_gradient_t`.

<code>vg_lite_gradient_spreadmode_t</code> String Values	Description
<code>VG_LITE_GRADIENT_SPREAD_FILL</code>	
<code>VG_LITE_GRADIENT_SPREAD_PAD</code>	

Vector Based Draw Operations

vg_lite_gradient_spreadmode_t String Values	Description
VG_LITE_GRADIENT_SPREAD_REPEAT	
VG_LITE_GRADIENT_SPREAD_REFLECT	

9.1.6 vg_lite_pattern_mode_t Enumeration

Defines how the region outside the image pattern is filled for the path.

Used in function: `vg_lite_draw_grad`, `vg_lite_draw_pattern`.

vg_lite_pattern_mode_t String Values	Description
VG_LITE_PATTERN_COLOR	Pixels outside the bounds of the source image should be taken as the color
VG_LITE_PATTERN_PAD	Pixels outside the bounds of the source image should be taken as having the same color as the closest edge pixel. The color of the pattern border is expanded to fill the region outside the pattern.
VG_LITE_PATTERN_REPEAT	Pixels outside the bounds of the source image should be repeated indefinitely in all directions. <i>(from March 2023)</i>
VG_LITE_PATTERN_REFLECT	Pixels outside the bounds of the source image should be reflected indefinitely in all directions. <i>(from March 2023)</i>

9.1.7 vg_lite_radial_gradient_spreadmode_t Enumeration

(Deprecated March 2023) use `vg_lite_gradient_spreadmode_t`. Defines the radial gradient padding mode. *(from Nov 2020, requires GC355 hardware)*

Used in structure: `vg_lite_radial_gradient_t`.

vg_lite_radial_gradient_spreadmode_t String Values	Description
VG_LITE_RADIAL_GRADIENT_SPREAD_FILL = 0	
VG_LITE_RADIAL_GRADIENT_SPREAD_PAD	
VG_LITE_RADIAL_GRADIENT_SPREAD_REPEAT	
VG_LITE_RADIAL_GRADIENT_SPREAD_REFLECT	

9.2 Draw and Gradient Structures

9.2.1 vg_lite_buffer_t Structure

Defined under Pixel Buffer Structures. [LINK to vg_lite_buffer_t structure.](#)

9.2.2 vg_lite_color_ramp_t Structure

This structure defines the stops for the radial gradient. The five parameters provide the offset and color for the stop. Each stop is defined by a set of floating point values which specify the offset and the sRGBA color and alpha values. Color channel values are in the form of a non-premultiplied (R, G, B, alpha) quad. All parameters are in the range of [0,1]. The red, green, blue, alpha value of [0, 1] is mapped to an 8-bit pixel value [0, 255]. *(from November 2020, requires GC355 hardware)*

Vector Based Draw Operations

The define for the max number of radial gradient stops is `#define MAX_COLOR_RAMP_STOPS 256`.

Used in radial gradient structure: `vg_lite_radial_gradient_t`.

vg_lite_color_ramp_t Members	Type	Description
stop	<code>vg_lite_float_t</code>	Offset value for the color stop
red	<code>vg_lite_float_t</code>	Red color channel value for the color stop
green	<code>vg_lite_float_t</code>	Green color channel value for the color stop
blue	<code>vg_lite_float_t</code>	Blue color channel value for the color stop
alpha	<code>vg_lite_float_t</code>	Alpha color channel value for the color stop

9.2.3 `vg_lite_linear_gradient_t` Structure

This structure defines the organization of a linear gradient in VGLite data. The linear gradient is applied to filling a path. It will generate a 256x1 image according to the specified settings.

Used in init and draw functions: `vg_lite_init_grad`, `vg_lite_set_grad`, `vg_lite_update_grad`, `vg_lite_get_grad_matrix`, `vg_lite_clear_grad`, `vg_lite_draw_grad`.

vg_lite_linear_gradient_t Constants	Type	Description
<code>VLC_MAX_GRADIENT_STOPS</code>	<code>vg_lite_int32_t</code>	Constant. Maximum number of gradient colors = 16.
vg_lite_linear_gradient_t Members	Type	Description
<code>colors[VLC_MAX_GRADIENT_STOPS]</code>	<code>vg_lite_uint32_t</code>	Color array for the gradient
<code>count</code>	<code>vg_lite_uint32_t</code>	Number of colors
<code>stops[VLC_MAX_GRADIENT_STOPS]</code>	<code>vg_lite_uint32_t</code>	Number of color stops, from 0 to 255
<code>matrix</code>	<code>vg_lite_matrix_t</code>	Struct for the matrix to transform the gradient color ramp
<code>image</code>	<code>vg_lite_buffer_t</code>	Image object struct to represent the color ramp

9.2.4 `vg_lite_ext_linear_gradient` Structure

This structure defines the organization of the extended parameters possible for a linear gradient. *(from April 2022)*

Used in functions: `vg_lite_draw_linear_grad`.

vg_lite_ext_linear_gradient_t Members	Type	Description
<code>count</code>	<code>vg_lite_uint32_t</code>	Count of colors, up to 256.
<code>matrix</code>	<code>vg_lite_matrix_t</code>	The matrix to transform the gradient.
<code>image</code>	<code>vg_lite_buffer_t</code>	The image for rendering as gradient pattern.
<code>linear_grad</code>	<code>vg_lite_linear_gradient_parameter_t</code>	Linear gradient parameters. Includes center point, focal point and radius.

Vector Based Draw Operations

vg_lite_ext_linear_gradient_t Members	Type	Description
ramp_length	vg_lite_uint32_t	Color ramp length for gradient paints provided to the driver
color_ramp[VLC_MAX_COLOR_RAMP_STOPS]	vg_lite_color_ramp_t	Color ramp parameter for gradient paints provided to the driver
converted_length	vg_lite_uint32_t	Converted internal color ramp length.
converted_ramp[VLC_MAX_COLOR_RAMP_STOPS+2]	vg_lite_color_ramp_t	Converted internal color ramp.
pre-multiplied	vg_lite_uint8_t	If this value is set to 1, the color value of color_ramp will be multiplied by the alpha value of color_ramp.
spread_mode	vg_lite_radial_gradient_spreadmode_t	The spread mode that is applied to the pixels out of the image after transformed.

9.2.5 vg_lite_linear_gradient_parameter Structure

This structure defines radial direction for a linear gradient. *(from April 2022)*

Line0 connects point (X0, Y0) to point (X1, Y1) and represents the radial direction of the linear gradient.

Line1 is a line perpendicular to line0 which passes through point (X0, Y0).

Line2 is a line perpendicular to line0 which passes through point (X1, Y1)

The linear gradient paint is applied at the intersection of the path fill area and the plane starting from line 1 and ending at line 2.

Used in structure: vg_lite_ext_linear_gradient.

Used in functions: vg_lite_set_linear_grad.

vg_lite_linear_gradient_parameter_t Members	Type	Description
X0	vg_lite_float_t	X origin of linear gradient radial direction.
Y0	vg_lite_float_t	Y origin of linear gradient radial direction.
X1	vg_lite_float_t	X end point of linear gradient radial direction.
Y1	vg_lite_float_t	Y end point of linear gradient radial direction.

9.2.6 vg_lite_matrix_t Structure

Defined under Matrix Structures. LINK to vg_lite_matrix_t structure.

9.2.7 vg_lite_path_t Structure

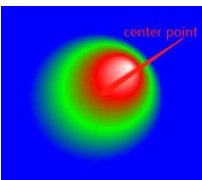

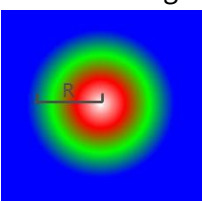

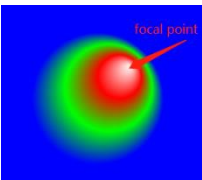

Defined under Vector Path Structures. LINK to vg_lite_path_t structure.

Vector Based Draw Operations

9.2.8 `vg_lite_radial_gradient_parameter_t` Structure

This structure defines the gradient radius and the X and Y coordinates for the center and focal points of the gradient. (from November 2020, requires GC355 or GC555 hardware)

Used in radial gradient structure: `vg_lite_radial_gradient_t`.

<code>vg_lite_radial_gradient_parameter_t</code> Members	Type	Description <i>(member order updated from August 2021)</i>
<code>cx</code>	<code>vg_lite_float_t</code>	Coordinates x and y of the gradient color center point. 
<code>cy</code>	<code>vg_lite_float_t</code>	
<code>r</code>	<code>vg_lite_float_t</code>	Radius of the gradient. 
<code>fx</code>	<code>vg_lite_float_t</code>	Coordinates x and y of the gradient color focal point 
<code>fy</code>	<code>vg_lite_float_t</code>	
		Focal point refers to the center of the gradient color.

9.2.9 `vg_lite_radial_gradient_t` Structure

This structure defines the application of the radial gradient to fill a path. *(from November 2020, requires GC355 or GC555 hardware).*

Used in radial gradient functions: `vg_lite_draw_grad`, `vg_lite_set_radial_grad`, `vg_lite_update_radial_grad`, `vg_lite_get_radial_grad`, `vg_lite_clear_radial_grad`

<code>vg_lite_radial_gradient_t</code> Members	Type	Description
<code>count</code>	<code>vg_lite_uint32_t</code>	Count of colors, up to 256
<code>matrix</code>	<code>vg_lite_matrix_t</code>	Structure which specifies the transform matrix for the gradient
<code>image</code>	<code>vg_lite_buffer_t</code>	Structure which specifies the image for rendering as a gradient pattern
<code>radial_grad</code>	<code>vg_lite_radial_gradient_parameter_t</code>	Structure which specifies the location of the gradient's center point (cx, cy), focal point(fx, fy) and radius(r)

Vector Based Draw Operations

vg_lite_radial_gradient_t Members	Type	Description
ramp_length	vg_lite_uint32_t	Color ramp parameters for gradient paints provided to the driver
color_ramp[VLC_MAX_COLOR_RAMP_STOPS]	vg_lite_color_ramp_t	Structure which specifies the color ramp.
converted_length	vg_lite_uint32_t	Converted internal color ramp
converted_ramp[VLC_MAX_COLOR_RAMP_STOPS+2]	vg_lite_color_ramp_t	Structure which specifies the Internal color ramp.
pre_multiplied	vg_lite_uint32_t	If this value is set to 1, the color value of color_ramp will be multiplied by the alpha value of color_ramp.
spread_mode	vg_lite_radial_gradient_spreadmode_t	Enum which specifies the tiling mode that is applied to the pixels out of the image after transformation.

9.3 Draw Functions

9.3.1 vg_lite_draw

Description

Performs a hardware accelerated 2D vector draw operation.

The size of the tessellation buffer can be specified, and that size will be aligned to the minimum required alignment of the hardware by the kernel. If you make the tessellation buffer smaller, less memory will be allocated, but a path might be sent down to the hardware multiple times because the hardware will walk the target with the provided tessellation window size, so performance might be lower. It is good practice to set the tessellation buffer size to the most common path size. For example, if all you do is render up to 24-pt fonts, you can set the tessellation buffer to be 24x24.

Note:

- All the color formats available in the [vg_lite_buffer_format_t](#) enum are supported as the destination buffer for the draw function.
- Strokes are not supported by the hardware. They need to be converted to paths before being used in the draw API.

Syntax

```
vg_lite_error_t vg_lite_draw (
    vg_lite_buffer_t          *target,
    vg_lite_path_t            *path,
    vg_lite_fill_t            fill_rule,
    vg_lite_matrix_t          *matrix,
    vg_lite_blend_t           blend,
```

Vector Based Draw Operations

```

        vg_lite_color_t          color
    );

```

Parameters

*target	Pointer to the vg_lite_buffer_t structure for the destination buffer. All color formats available in the vg_lite_buffer_format_t enum are valid destination formats for the draw function.
*path	Pointer to the vg_lite_path_t structure containing path data which describes the path to draw. Refer to the section on Vector Path Data Opcodes in this document for opcode detail.
fill_rule	Specifies the vg_lite_fill_t enum value for the fill rule for the path.
*matrix	Pointer to a vg_lite_matrix_t structure that defines the affine transformation matrix of the path. If matrix is NULL, an identity matrix is assumed. Note: non-affine transformation is not supported for vg_lite_draw , so a perspective transformation matrix has no effect on path.
blend	Select one of the hardware supported blend modes in the vg_lite_blend_t enum to be applied to each drawn pixel. If no blending is required, set this value to VG_LITE_BLEND_NONE (0).
color	The color applied to each pixel drawn by the path.

9.3.2 vg_lite_draw_grad

Description

This function is used to fill a path with a gradient according to specified fill rules. The specified path will be transformed according to the selected matrix and filled with the gradient.

Syntax

```

vg_lite_error_t vg_lite_draw_grad (
    vg_lite_buffer_t          *target,
    vg_lite_path_t            *path,
    vg_lite_fill_t            fill_rule,
    vg_lite_matrix_t          *matrix,
    vg_lite_linear_gradient_t *grad,
    vg_lite_blend_t           blend
);

```

Parameters

*target	Pointer to the vg_lite_buffer_t structure containing data describing the target path.
*path	Pointer to the vg_lite_path_t structure containing path data which describes the path to draw for the linear gradient. Refer to the section on Vector Path Data Opcodes in this document for opcode detail.
fill_rule	Specifies the vg_lite_fill_t enum value for the fill rule for the path.
*matrix	Pointer to a vg_lite_matrix_t structure that defines the 3x3 transformation matrix of the path. If matrix is NULL, an identity matrix is assumed which is usually a bad idea since the path can be anything.
*grad	Pointer to the vg_lite_linear_gradient_t structure which contains the values to be used to fill the path.

Vector Based Draw Operations

blend	Specified the blend mode in the vg_lite_blend_t enum to be applied to each drawn pixel. If no blending is required, set this value to VG_LITE_BLEND_NONE (0).
-------	---

9.3.3 vg_lite_draw_radial_grad

Description

This function is used to fill a path with a radial gradient according to specified fill rules. The specified path will be transformed according to the selected matrix and filled with the gradient.

Application can use VGLite API [vg_lite_query_feature](#) (gcFEATURE_BIT_VG_RADIAL_GRADIENT) to determine HW support for radial gradient.

Syntax

```
vg_lite_error_t vg_lite_draw_radial_grad (
    vg_lite_buffer_t          *target,
    vg_lite_path_t            *path,
    vg_lite_fill_t            fill_rule,
    vg_lite_matrix_t          *path_matrix,
    vg_lite_radial_gradient_t *grad,
    vg_lite_color_t           paint_color,
    vg_lite_blend_t           blend,
    vg_lite_filter_t          filter
);
```

Parameters

*target	Pointer to the vg_lite_buffer_t structure containing data describing the target path.
*path	Pointer to the vg_lite_path_t structure containing path data which describes the path to draw for the linear gradient. Refer to the section on Vector Path Data Opcodes in this document for opcode detail.
fill_rule	Specifies the vg_lite_fill_t enum value for the fill rule for the path.
*path_matrix	Pointer to a vg_lite_matrix_t structure that defines the 3x3 transformation matrix of the path. If matrix is NULL, an identity matrix is assumed which is usually a bad idea since the path can be anything.
*grad	Pointer to the vg_lite_radial_gradient_t structure which contains the values to be used to fill the path. Note: grad->image.image_mode does not support VG_LITE_MULTIPLY_IMAGE_MODE.
paint_color	Specifies the paint color vg_lite_color_t RGBA value to be applied by VG_LITE_RADIAL_GRADIENT_SPREAD_FILL, which set by function vg_lite_set_radial_grad . When pixels are out of the image after transformation, this paint_color is applied to them. See also enum vg_lite_radial_gradient_spreadmode_t .
blend	Specifies the blend mode in the vg_lite_blend_t enum to be applied to each drawn pixel. If no blending is required, set this value to VG_LITE_BLEND_NONE (0).

Vector Based Draw Operations

filter	Specified the filter mode vg_lite_filter_t enum value to be applied to each drawn pixel. If no filtering is required, set this value to VG_LITE_BLEND_POINT (0).
--------	--

9.3.4 [vg_lite_draw_pattern](#)

Description

This function fills a path with an image pattern. The path will be transformed according to the specified matrix and filled with the transformed image pattern.

Syntax

```
vg_lite_error_t vg_lite_draw_pattern (
    vg_lite_buffer_t          *target,
    vg_lite_path_t            *path,
    vg_lite_fill_t            fill_rule,
    vg_lite_matrix_t          *path_matrix,
    vg_lite_buffer_t          *pattern_image,
    vg_lite_matrix_t          *pattern_matrix,
    vg_lite_blend_t           blend,
    vg_lite_pattern_mode_t    pattern_mode,
    vg_lite_color_t           pattern_color,
    vg_lite_color_t           color,
    vg_lite_filter_t          filter
);
```

Parameters

*target	Pointer to the vg_lite_buffer_t structure that defines the path to draw.
*path	Pointer to the vg_lite_path_t structure containing path data which describes the path to draw. Refer to the section on Vector Path Data Opcodes in this document for opcode detail.
fill_rule	Specifies the vg_lite_fill_t enum value for the fill rule for the path.
*path_matrix	Pointer to a vg_lite_matrix_t structure that defines the 3x3 transformation matrix of the path. If matrix is NULL, an identity matrix is assumed, which is usually a bad idea since the path can be anything.
*pattern_image	Pointer to the vg_lite_buffer_t structure that describes the image pattern. Note: pattern_image->image_mode does not support VG_LITE_MULTIPLY_IMAGE_MODE in this API.
*pattern_matrix	Pointer to a vg_lite_matrix_t structure that defines the 3x3 transformation matrix of the source pixels into the target. If matrix is NULL, an identity matrix is assumed, meaning the source will be copied directly onto the target at 0,0 location.
blend	Specifies one of the vg_lite_blend_t enum values for hardware supported blend modes to be applied to each drawn pixel in the image. If no blending is required, set this value to VG_LITE_BLEND_NONE (0).
pattern_mode	Specifies the vg_lite_pattern_mode_t value which defines how the region outside the image pattern is to be filled.

Vector Based Draw Operations

pattern_color	Specifies a 32bpp ARGB color (vg_lite_color_t) to be applied to the fill outside the image pattern area when the pattern_mode value is VG_LITE_PATTERN_COLOR. <i>(from Dec 2019, type now vg_lite_color_t, previously was uint32_t)</i>
color	Specifies a 32bpp ARGB color (vg_lite_color_t) to be applied as a mix color. If non-zero, the mix color value gets multiplied with each source pixel before blending happens. If a mix color is not needed, set the color parameter to 0. <i>(from May 2023)</i>
filter	Specifies the filter type. All formats available in the vg_lite_filter_t enum are valid formats for this function. A value of zero (0) indicates VG_LITE_FILTER_POINT.

9.4 Linear Gradient Initialization and Control Functions

This part of the API performs linear gradient operations.

A color gradient (color progression, color ramp) is a smooth transition between a set of colors (color stops) that is done along a line (linear, or axial color gradient) or radially, along concentric circles (radial color gradient). The color transition is done by linear interpolation between two consecutive color stops.

Note: VGLite supports linear color gradients for GCNanoLiteV and GCNanoUltraV. Both linear and radial gradients are supported with GC355 and GC555.

9.4.1 [vg_lite_init_grad](#)

Description

This function initializes the internal buffer for the linear gradient object with default settings for rendering.

Syntax

```
vg_lite_error_t vg_lite_init_grad (
    vg_lite_linear_gradient_t      *grad,
);
```

Parameters

*grad	Pointer to the vg_lite_linear_gradient_t structure which defines the gradient to be initialized. Default values are used.
-------	---

9.4.2 [vg_lite_clear_grad](#)

Description

This function is used to clear the values of a linear gradient object and free the image buffer's memory.

Syntax

```
vg_lite_error_t vg_lite_clear_grad (
    vg_lite_linear_gradient_t      *grad,
);
```

Parameters

*grad	Pointer to the vg_lite_linear_gradient_t structure which is to be cleared.
-------	--

Vector Based Draw Operations

9.4.3 vg_lite_set_grad

Description

This function is used to set values for the members of the [vg_lite_linear_gradient_t](#) structure.

Note: `vg_lite_set_grad` API adopts the following rules to set the default gradient colors if the input parameters are incomplete or invalid.

1. If no valid stops have been specified (e.g., due to an empty input array, out-of-range, or out-of-order stops), a stop at 0 with (R, G, B, α) color (0.0, 0.0, 0.0, 1.0) (opaque black) and a stop at 1 with color (1.0, 1.0, 1.0, 1.0) (opaque white) are implicitly defined.
2. If at least one valid stop has been specified, but none has been defined with an offset of 0, an implicit stop is added with an offset of 0 and the same color as the first user-defined stop.
3. If at least one valid stop has been specified, but none has been defined with an offset of 1, an implicit stop is added with an offset of 1 and the same color as the last user-defined stop.

Syntax

```
vg_lite_error_t vg_lite_set_grad (
    vg_lite_linear_gradient_t *grad,
    vg_lite_uint32_t          count,
    vg_lite_uint32_t          *colors,
    vg_lite_uint32_t          *stops
);
```

Parameters

*grad	Pointer to the vg_lite_linear_gradient_t structure to be set.
count	This is the count of the colors in the linear gradient. The maximum color stop count is defined by VLC_MAX_GRAD which is 16.
*colors	Specifies the color array for the gradient stops. The color is in ARGB8888 format with alpha in the upper byte.
*stops	Pointer to the gradient stop offset.

Returns

Always returns VG_LITE_SUCCESS.

Vector Based Draw Operations

9.4.4 `vg_lite_get_grad_matrix`

Description

This function is used to get a pointer to the gradient object's transformation matrix. This allows an application to manipulate the matrix to facilitate correct rendering of the gradient path.

Syntax

```
vg_lite_error_t vg_lite_get_grad_matrix (
    vg_lite_linear_gradient_t  *grad,
);
```

Parameters

*grad	Pointer to the vg_lite_linear_gradient_t structure which contains the matrix to be retrieved.
-------	---

9.4.5 `vg_lite_update_grad`

Description

This function is used to update or generate values for an image object that is going to be rendered. The `vg_lite_linear_gradient_t` object has an image buffer which is used to render the gradient pattern. The image buffer will be created or updated with the corresponding grad parameters.

Syntax

```
vg_lite_error_t vg_lite_update_grad (
    vg_lite_linear_gradient_t  *grad,
);
```

Parameters

*grad	Pointer to the vg_lite_linear_gradient_t structure which contains the update values to be used for the object to be rendered.
-------	---

Vector Based Draw Operations

9.5 Linear Gradient Extended Functions

The following functions are available only with IP which includes hardware support for extended linear gradient capabilities, such as GC355 and GC555. These functions are not available with GCNanoLiteV, GCNanoUltraV or GCNanoV.

Applications can use VGLite API [vg_lite_query_feature](#)(gcFEATURE_BIT_VG_LINEAR_GRADIENT_EXT) to determine HW support for linear gradient.

9.5.1 [vg_lite_set_linear_grad](#)

Description

This function is used to set the values which define the linear gradient. (from April 2022)

Syntax

```
vg_lite_error_t vg_lite_set_linear_grad (
    vg_lite_ext_linear_gradient_t    *grad,
    vg_lite_uint32_t                 count,
    vg_lite_color_ramp_t              *color_ramp,
    vg_lite_linear_gradient_parameter_t grad_param,
    vg_lite_radial_gradient_spreadmode_t spread_mode,
    vg_lite_uint8_t                   pre_mult
);
```

Parameters

*grad	Pointer to the vg_lite_ext_linear_gradient_t structure which is to be set.
count	Count of the colors in the gradient. The maximum color stop count is defined by MAX_COLOR_RAMP_STOPS, which is currently 256.
*color_ramp	This is the stop for the linear gradient. The number of parameters is 5, and gives the offset and color of the stop. Each stop is defined by a floating-point offset value and four floating-point values containing the sRGBA color and alpha value associated with each stop, in the form of a non-premultiplied (R, G, B, alpha) quad. And the range of all parameters in it is [0,1].
grad_param	Gradient parameters as specified in structure vg_lite_linear_gradient_parameter_t .
spread_mode	The tiling mode applied to the pixels out of the paint after transformation. Uses the same spread mode enumeration types as radial gradient. See vg_lite_radial_gradient_spreadmode_t enum.
pre_mult	This parameter controls whether color and alpha values are interpolated in premultiplied or non-premultiplied form.

Returns

Returns VG_LITE_INVALID_ARGUMENTS to indicate the parameters are wrong.

Vector Based Draw Operations

9.5.2 `vg_lite_get_linear_grad_matrix`

Description

This function returns a pointer to an extended linear gradient object's matrix. *(from March 2023)*

Syntax

```
vg_lite_matrix_t* vg_lite_get_linear_grad_matrix (
    vg_lite_ext_linear_gradient_t  *grad,
);
```

Parameters

*grad	Pointer to the vg_lite_ext_linear_gradient_t structure
-------	--

Returns

Returns a pointer to a `vg_lite_matrix_t` for the specified extended linear gradient.

9.5.3 `vg_lite_draw_linear_grad`

Description

This function is used to fill a path with a linear gradient according to specified fill rules. The specified path will be transformed according to the selected matrix and filled with the transformed linear gradient. *(from April 2022)*

Syntax

```
vg_lite_error_t vg_lite_draw_linear_grad (
    vg_lite_buffer_t          *target,
    vg_lite_path_t            *path,
    vg_lite_fill_t            fill_rule,
    vg_lite_matrix_t          *path_matrix,
    vg_lite_ext_linear_gradient_t *grad,
    vg_lite_color_t           paint_color,
    vg_lite_blend_t           blend,
    vg_lite_filter_t          filter
);
```

Parameters

*target	Pointer to the vg_lite_buffer_t structure containing data describing the target path.
*path	Pointer to the vg_lite_path_t structure containing path data which describes the path to draw for the linear gradient. Refer to the section on Vector Path Data Opcodes in this document for opcode detail.
fill_rule	Specifies the vg_lite_fill_t enum value for the fill rule for the path.

Vector Based Draw Operations

*path_matrix	Pointer to a vg_lite_matrix_t structure that defines the 3x3 transformation matrix of the path. If matrix is NULL, an identity matrix is assumed which is usually a bad idea since the path can be anything.
*grad	Pointer to the vg_lite_ext_linear_gradient_t structure which contains the values to be used to fill the path. Note: grad->image.image_mode does not support VG_LITE_MULTIPLY_IMAGE_MODE.
paint_color	Specifies the paint color vg_lite_color_t RGBA value to be applied by VG_LITE_RADIAL_GRADIENT_SPREAD_FILL, which set by function vg_lite_set_linear_grad . When pixels are out of the image after transformation, this paint_color is applied to them. See also enum vg_lite_radial_gradient_spreadmode_t .
blend	Specifies the blend mode in the vg_lite_blend_t enum to be applied to each drawn pixel. If no blending is required, set this value to VG_LITE_BLEND_NONE (0).
filter	Specified the filter mode vg_lite_filter_t enum value to be applied to each drawn pixel. If no filtering is required, set this value to VG_LITE_BLEND_POINT (0).

9.5.4 vg_lite_update_linear_grad

Description

This function is used to update or generate the corresponding image object to render. *(from April 2022)*

The [vg_lite_ext_linear_gradient_t](#) object has an image buffer which is used to render the linear gradient paint. The image buffer will be created/updated according to the specified grad parameters.

Syntax

```
vg_lite_error_t vg_lite_update_linear_grad (
    vg_lite_ext_linear_gradient_t  *grad,
);
```

Parameters

*grad	Pointer to the vg_lite_ext_linear_gradient_t structure which is to be updated or created.
-------	---

9.5.5 vg_lite_clear_linear_grad

Description

This function is used to clear the linear gradient object. This will reset the grad members and free the image buffer's memory. *(from April 2022)*

Syntax

```
vg_lite_error_t vg_lite_clear_linear_grad (
    vg_lite_ext_linear_gradient_t  *grad,
);
```

Parameters

*grad	Pointer to the vg_lite_ext_linear_gradient_t structure which is to be cleared.
-------	--

Vector Based Draw Operations

9.6 Radial Gradient Functions

The following functions are available only with IP which supports radial gradients, such as GC355 and GC555. These functions are not available with GCNanoLiteV, or GCNanoUltraV or GCNanoV. Note: There is no init function required for radial gradients. Buffer initialization is done through the `vg_lite_update_radial_grad` function. *(from Nov 2020, requires GC355 or GC555 hardware)*

9.6.1 `vg_lite_set_radial_grad`

Description

This function is used to set the values for the radial linear gradient definition. (from November 2020, requires GC355 or GC555 hardware).

Syntax

```
vg_lite_error_t vg_lite_set_radial_grad (
    vg_lite_radial_gradient_t      *grad,
    vg_lite_uint32_t               count,
    vg_lite_color_ramp_t           *color_ramp,
    vg_lite_radial_gradient_parameter_t grad_param,
    vg_lite_radial_gradient_spreadmode_t spread_mode,
    vg_lite_uint8_t               pre_mult
);
```

Parameters

<code>*grad</code>	Pointer to the vg_lite_radial_gradient_t structure for the radial gradient which will be set
<code>count</code>	This is the count of the color stops in the gradient. The maximum color stop count is defined by <code>MAX_COLOR_RAMP_STOPS</code> , which is currently 256.
<code>*color_ramp</code>	Pointer to the vg_lite_color_ramp_t structure which defines the stops for the radial gradient. The five parameters provide the offset and color for the stop. Each stop is defined by a set of floating point values which specify the offset and the sRGBA color and alpha values. Color channel values are in the form of a non-premultiplied (R, G, B, alpha) quad. All parameters are in the range of [0,1]. The red, green, blue, alpha value of [0, 1] is mapped to an 8-bit pixel value [0, 255].
<code>grad_param</code>	The radial gradient parameters are supplied as a vector of 5 floats in the order {cx, cy, fx, fy, r}. Parameters (cx, cy) specify the center point, (fx,fy) the focal point and r the radius. See struct vg_lite_radial_gradient_parameter_t .
<code>spread_mode</code>	The tiling mode that is applied to pixels out of the paint after transformation. See enum vg_lite_radial_gradient_spreadmode_t .
<code>pre_mult</code>	Controls whether color and alpha values are interpolated in premultiplied or non-premultiplied form. If this value is set to 1, the color value of <code>vgColorRamp</code> will be multiplied by the alpha value of <code>vgColorRamp</code> .

Returns

Returns `VG_LITE_INVALID_ARGUMENTS` to indicate the parameters are wrong.

Vector Based Draw Operations

9.6.2 `vg_lite_update_radial_grad`

Description

This function is used to update or generate values for an image object that is going to be rendered. The `vg_lite_radial_gradient_t` object has an image buffer which is used to render the gradient pattern. The image buffer will be created or updated with the corresponding gradient parameters. *(from November 2020, requires GC355 or GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_update_radial_grad (
    vg_lite_radial_gradient_t *grad,
);
```

Parameters

<code>*grad</code>	Pointer to the vg_lite_radial_gradient_t structure which contains the update values to be used for the object to be rendered.
--------------------	---

9.6.3 `vg_lite_get_radial_grad_matrix`

Description

This function is used to get a pointer to the radial gradient object's transformation matrix. This allows an application to manipulate the matrix to facilitate correct rendering of the gradient path. *(from Nov 2020, requires GC355 or GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_get_radial_grad_matrix (
    vg_lite_radial_gradient_t *grad,
);
```

Parameters

<code>*grad</code>	Pointer to the vg_lite_radial_gradient_t structure which contains the matrix to be retrieved.
--------------------	---

Vector Based Draw Operations**9.6.4 vg_lite_clear_radial_grad****Description**

This function is used to clear the values of a radial gradient object and free the image buffer's memory. *(from Nov 2020, requires GC355 or GC555 hardware)*

Syntax

```
vg_lite_error_t vg_lite_clear_radial_grad (  
    vg_lite_radial_gradient_t    *grad,  
);
```

Parameters

*grad	Pointer to the vg_lite_radial_gradient_t structure which is to be cleared.
-------	--

Stroke Operations

10 Stroke Operations

This part of the API performs stroke operations. *(from March 2022)*

10.1 Stroke Enumerations

10.1.1 `vg_lite_cap_style_t` Enumeration

Defines the style of cap at the end of a stroke. *(from March 2022)*

- Used in structure: `vg_lite_stroke_t`.
- Used in function: `vg_lite_set_stroke`.

<code>vg_lite_cap_style_t</code> String Values	Description
<code>VG_LITE_CAP_BUTT</code>	The Butt end cap style terminates each segment with a line perpendicular to the tangent at each endpoint.
<code>VG_LITE_CAP_ROUND</code>	The Round end cap style appends a semicircle with a diameter equal to the line width centered around each endpoint.
<code>VG_LITE_CAP_SQUARE</code>	The Square end cap style appends a rectangle with two sides of length equal to the line width perpendicular to the tangent, and two sides of length equal to half the line width parallel to the tangent, at each endpoint.

10.1.2 `vg_lite_path_type_t` Enumeration

Defines the type of draw path. *(from March 2022)*

- Used in structure: `vg_lite_path_t`, `vg_lite_stroke_t`.
- Used in function: `vg_lite_set_path_type`.

<code>vg_lite_path_type_t</code> String Values	Description
<code>VG_LITE_DRAW_FILL_PATH</code>	Draw path is fill.
<code>VG_LITE_DRAW_STROKE_PATH</code>	Draw path is stroke.
<code>VG_LITE_DRAW_FILL_STROKE_PATH</code>	Draw path is both fill and stroke.

Stroke Operations

10.1.3 `vg_lite_join_style_t` Enumeration

Defines the type of styles available for line joints. *(from March 2022)*

- Used in structure: `vg_lite_stroke_t`.
- Used in function: `vg_lite_set_stroke`.

<code>vg_lite_join_style_t</code> String Values	Description
<code>VG_LITE_JOIN_MITER</code>	The Miter join style appends a trapezoid with one vertex at the intersection point of the two original lines, two adjacent vertices at the outer endpoints of the two “fattened” lines and a fourth vertex at the extrapolated intersection point of the outer perimeters of the two “fattened” lines.
<code>VG_LITE_JOIN_ROUND</code>	The Round join style appends a wedge-shaped portion of a circle, centered at the intersection point of the two original lines, having a radius equal to half the line width.
<code>VG_LITE_JOIN_BEVEL</code>	The Bevel join style appends a triangle with two vertices at the outer endpoints of the two “fattened” lines and a third vertex at the intersection point of the two original lines.

10.2 Stroke Structures

10.2.1 `vg_lite_path_t` Structure

Defined under Vector Path Structures. [LINK to `vg_lite_path_t` structure](#). *(additional members added for stroke from March 2022)*

10.2.2 `vg_lite_path_list_t` Structure

The structure `vg_lite_path_list_ptr` points to a `vg_lite_path_list` structure which provides divided path data according to `MOVE/MOVE_REL`. *(from Aug 2023)*

- Used (`vg_lite_path_list_ptr`) in structures: `vg_lite_stroke_t`.

<code>vg_lite_path_list_t</code> Members	Type	Description
<code>path_points</code>	<code>vg_lite_path_point_ptr</code>	
<code>path_end</code>	<code>vg_lite_path_point_ptr</code>	
<code>point_count</code>	<code>vg_lite_uint32_t</code>	
<code>next</code>	<code>vg_lite_path_list_ptr</code>	
<code>closed</code>	<code>vg_lite_uint8_t</code>	

Stroke Operations

10.2.3 `vg_lite_path_point_t` Structure

The structure `vg_lite_path_point_ptr` points to a `vg_lite_path_point` structure which provides path detail. *(from March 2022)*

- Used (`vg_lite_path_point_ptr`) in structures: `vg_lite_path_point_t`, `vg_lite_stroke_conversion`, `vg_lite_sub_path_t`.

<code>vg_lite_path_point_t</code> Members	Type	Description
<code>x</code>	<code>vg_lite_float_t</code>	X coordinate
<code>y</code>	<code>vg_lite_float_t</code>	Y coordinate
<code>flatten_flag</code>	<code>vg_lite_uint8_t</code>	Flatten flag for flattened path
<code>curve_type</code>	<code>vg_lite_uint8_t</code>	Curve type for the stroke path
<code>tangentX</code>	<code>vg_lite_float_t</code>	X tangent (Note: #define centerX tangent)
<code>tangentY</code>	<code>vg_lite_float_t</code>	Y tangent (Note: #define centerX tangent)
<code>length</code>	<code>vg_lite_float_t</code>	Line length
<code>prev</code>	<code>vg_lite_path_point_ptr</code>	Pointer to the previous point node

10.2.4 `vg_lite_stroke_t` Structure

The structure provides stroke parameters and pointers to temp storage for a stroke sub path. Refer to function `vg_lite_set_stroke` parameter descriptions for additional description for some members. *(from March 2022)*

- Used in structure: `vg_lite_path_t`.

<code>vg_lite_stroke_t</code> Members	Type	Description
<code>cap_style</code>	<code>vg_lite_cap_style_t</code>	Stroke cap style
<code>join_style</code>	<code>vg_lite_join_style_t</code>	Stroke joint style
<code>line_width</code>	<code>vg_lite_float_t</code>	Stroke line width
<code>miter_limit</code>	<code>vg_lite_float_t</code>	Stroke miter limit
<code>*dash_pattern</code>	<code>vg_lite_float_t</code>	Pointer to stroke dash pattern
<code>pattern_count</code>	<code>vg_lite_uint32_t</code>	Number of dash pattern repetitions
<code>dash_phase</code>	<code>vg_lite_float_t</code>	Stroke dash phrase
<code>dash_length</code>	<code>vg_lite_float_t</code>	Stroke dash initial length
<code>dash_index</code>	<code>vg_lite_uint32_t</code>	Stroke dash initial index
<code>half_width</code>	<code>vg_lite_float_t</code>	Half line width
<code>pattern_length</code>	<code>vg_lite_float_t</code>	Total length of stroke dash patterns.
<code>miter_square</code>	<code>vg_lite_float_t</code>	For fast checking
<code>path_points</code>	<code>vg_lite_path_point_ptr</code>	Temp storage for stroke sub path
<code>path_end</code>	<code>vg_lite_path_point_ptr</code>	Temp storage for stroke sub path
<code>point_count</code>	<code>uint32_t</code>	Temp storage for stroke sub path
<code>left_point</code>	<code>vg_lite_path_point_ptr</code>	Temp storage for stroke sub path
<code>right_pont</code>	<code>vg_lite_path_point_ptr</code>	Temp storage for stroke sub path
<code>stroke_points</code>	<code>vg_lite_path_point_ptr</code>	Temp storage for stroke sub path

Stroke Operations

vg_lite_stroke_t Members	Type	Description
stroke_end	vg_lite_path_point_ptr	Temp storage for stroke sub path
stroke_count	vg_lite_uint32_t	Temp storage for stroke sub path
path_list_divide	vg_lite_path_list_ptr	Divide stroke path according to move or move_rel for avoiding implicit closure. <i>(from Aug 2023)</i>
cur_list	vg_lite_path_list_ptr	Pointer to current divided path data. <i>(from Aug 2023)</i>
add_end	vg_lite_uint8_t	Flag that adds end_path in driver <i>(from Aug 2023)</i>
dash_reset	vg_lite_uint8_t	<i>(from Aug 2023)</i>
stroke_paths	vg_lite_sub_path_ptr	
last_stroke	vg_lite_sub_path_ptr	
swing_handling	vg_lite_uint32_t	
swing_deltax	vg_lite_float_t	
swing_deltay	vg_lite_float_t	
swing_start	vg_lite_path_point_ptr	
swing_stroke	vg_lite_path_point_ptr	
swing_length	vg_lite_float_t	
swing_centlen	vg_lite_float_t	
swing_count	vg_lite_uint32_t	
need_swing	vg_lite_uint8_t	
swing_ccw	vg_lite_uint8_t	
stroke_length	vg_lite_float_t	
stroke_size	vg_lite_uint32_t	
fattened	vg_lite_uint8_t	the stroke line is fat line.
closed	vg_lite_uint8_t	

Stroke Operations

10.2.5 `vg_lite_sub_path_t` Structure

The structure `vg_lite_sub_path_ptr` points to a `vg_lite_sub_path` structure which provides sub path detail and a pointer to the next sub path. *(from March 2022)*

- Used in structure: `vg_lite_stroke_conversion`.

<code>vg_lite_path_point_t</code> Members	Type	Description
<code>next</code>	<code>vg_lite_sub_path_ptr</code>	Pointer to the next sub path
<code>point_count</code>	<code>vg_lite_uint32_t</code>	Number of points in the sub path
<code>point_list</code>	<code>vg_lite_path_point_ptr</code>	Pointer to the point list.
<code>end_point</code>	<code>vg_lite_path_point_ptr</code>	Pointer to the last point.
<code>closed</code>	<code>vg_lite_uint8_t</code>	Indicates whether or not the path is closed.
<code>length</code>	<code>vg_lite_float_t</code>	Length of the sub path.

10.3 Stroke Functions

All return `vg_lite_error_t` status.

10.3.1 `vg_lite_set_path_type`

Description

This function sets the path type. *(from March 2022)*

Syntax

```
vg_lite_error_t vg_lite_set_path_type (
    vg_lite_path_t          *path,
    vg_lite_path_type_t     path_type
);
```

Parameters:

<code>*path</code>	Pointer to the <code>vg_lite_path_t</code> structure that describes the path.
<code>path_type</code>	Pointer to a <code>vg_lite_path_type_t</code> structure that describes the path type.

Stroke Operations

10.3.2 vg_lite_set_stroke

Description

This function uses input parameters to set stroke attributes. *(from March 2022)*

Syntax

```
vg_lite_error_t vg_lite_set_stroke (
    vg_lite_path_t          *path,
    vg_lite_cap_style_t     cap_style,
    vg_lite_join_style_t    join_style,
    vg_lite_float_t         line_width,
    vg_lite_float_t         miter_limit,
    vg_lite_float_t         *dash_pattern,
    vg_lite_uint32_t        pattern_count,
    vg_lite_float_t         dash_phase,
    vg_lite_color_t         color
);
```

Parameters

*path	Pointer to the vg_lite_path_t structure that describes the path.
cap_style	The end cap style defined by the vg_lite_cap_style_t enum.
join_style	The line join style defined by the vg_lite_join_style_t enum.
line_width	The line width of the stroke path. A line width less than or equal to 0 prevents stroking from taking place.
miter_limit	When stroking using the Miter stroke vg_lite_join_style_t , the miter length (i.e., the length between the intersection points of the inner and outer perimeters of the two “fattened” lines) is compared to the product of the user-set miter limit and the line width. If the miter length exceeds this product, the Miter join is not drawn and a Bevel join is substituted. Note: Miter limit values less than 1 are silently clamped to 1.
*dash_pattern	Pointer to a dash pattern which consists of a sequence of lengths of alternating "on" and "off" dash segments. The first value of the dash array defines the length, in user coordinates, of the first "on" dash segment. The second value defines the length of the following "off" segment. Each subsequent pair of values defines one "on" and one "off" segment. Note: If the dash pattern has an odd number of elements, the final element is ignored.
pattern_count	The count of dash on/off segments.
dash_phase	Defines the starting point in the dash pattern that is associated with the start of the first segment of the path. For example, if the dash pattern is [10 20 30 40] and the dash phase is 35, the path will be stroked with an "on" segment of length 25 (skipping the first "on" segment of length 10, the following "off" segment of length 20, and the first 5 units of the next

Stroke Operations

	"on" segment), followed by an "off" segment of length 40. The pattern will then repeat from the beginning, with an "on" segment of length 10, an "off" segment of length 20, an "on" segment of length 30.
color	The stroke color.

10.3.3 `vg_lite_update_stroke`

Description

This function uses the path and stroke attributes as specified with function `vg_lite_set_stroke` to update the stroke path's parameters and generate stroke path data. *(from March 2022)*

Syntax

```
vg_lite_error_t vg_lite_update_stroke (
    vg_lite_path_t      *path,
);
```

Parameters

*path	Pointer to the vg_lite_path_t structure that describes the path.

Deprecated and Renamed APIs

11 Deprecated and Renamed APIs

The following functions are deprecated and are either obsolete or replaced by a more efficient implementation. Their use is discouraged and will produce unpredictable behaviors.

The names of some functions, enums and structures were modified during code refinements in 2022Q3. If the parameters did not change, the deprecated syntax detail is not provided below. Changes to enums and structs are not mentioned here, instead refer to the item itself.

Deprecated or Renamed API	Recommended Replacement API	Source file	Date Deprecated
vg_lite_perspective	n/a	vg_lite.h	August 2022
vg_lite_set_dither	vg_lite_enable_dither vg_lite_disable_dither	vg_lite.h	August 2022

Deprecated and Renamed APIs**11.1 Deprecated vg_lite Syntax**

Syntax for deprecated functions is provided below for reference. Note: this list does not include items renamed during code refinement of Sept 2022.

11.1.1 vg_lite_perspective (deprecated)**Syntax**

```
void vg_lite_perspective (  
    vg_lite_float_t          px,  
    vg_lite_float_t          py,  
    vg_lite_matrix_t         *matrix  
);
```

11.1.2 vg_lite_set_dither (deprecated)**Syntax**

```
vg_lite_error_t vg_lite_set_dither (  
    int          enable  
);
```

11.1.3 vg_lite_set_scissor (deprecated)**Syntax**

```
vg_lite_error_t vg_lite_set_scissor (  
    int32_t          x,  
    int32_t          y,  
    int32_t          width,  
    int32_t          height  
);
```

) ;
```

VGLite API Programming Examples

12 VGLite API Programming Examples

12.1 vg_lite_clear Example

The *Conformance/samples/clear/clear.c* test program demonstrates the basic flow of a VGLite application program and the usage of the `vg_lite_clear` API. First, the program initializes the VGLite API with:

```
error = vg_lite_init(0, 0);
```

Note that as the tessellation buffer width and height are defined as (0, 0) in this `vg_lite_init` API call, this program cannot use the path rendering `vg_lite_draw` APIs. Only clear and blit APIs can be used in this program.

After initialization, the program allocates a 256x256 render buffer with a format of `VG_LITE_RGB565`.

```
buffer.width  = 256;  
buffer.height = 256;  
buffer.format = VG_LITE_RGB565;  
error = vg_lite_allocate(&buffer);  
fb = &buffer;
```

It clears the entire render buffer with blue color first with the `vg_lite_clear` API.

```
error = vg_lite_clear(fb, NULL, 0xFFFF0000);
```

Then it clears a 64x64 square at the position (64, 64) relative to the top-left origin of the render buffer.

```
vg_lite_rectangle_t rect = { 64, 64, 64, 64 };  
error = vg_lite_clear(fb, &rect, 0xFF0000FF);
```

After that, it calls `vg_lite_finish` to flush the commands to Vivante Vector Graphics hardware and then frees up the allocated render buffer. Finally, it calls `vg_lite_close` to destroy the VGLite context which is initialized by `vg_lite_init`.

```
vg_lite_finish();  
vg_lite_free(&buffer);  
vg_lite_close();
```

Figure 1 Example using `vg_lite_clear`

VGLite API Programming Examples

12.2 vg_lite_blit Example

The *Conformance/samples/ui/main.c* test program demonstrates the usage of the `vg_lite_blit` API. It clears a 320x480 render buffer with blue background color first, then it blits six 256x256 icon images to six different positions in the render buffer with a blit matrix for each icon. The blit matrix scales the original icon image to a proper size and translates the scaled icon to the right position in the render buffer. The `vg_lite_blit` API call is set as `VG_LITE_BLEND_SRC_OVER` so the icon image pixels with alpha value 0xFF cover the background blue color.

```
vg_lite_blit(fb, &icons[icon_id], &icon_matrix, VG_LITE_BLEND_SRC_OVER,
0, VG_LITE_FILTER_POINT);
```

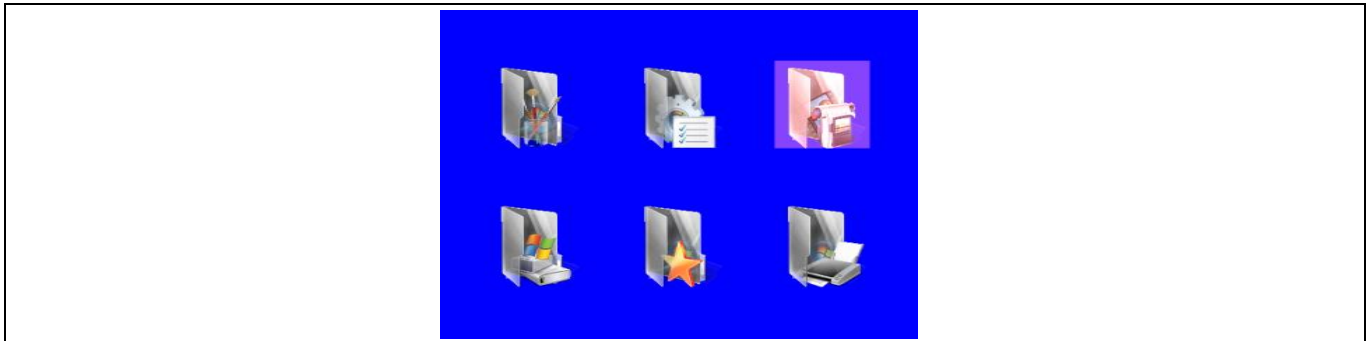

Figure 2 Example using `vg_lite_blit`

12.3 vg_lite_draw Example

The *Conformance/samples/ui/main.c* test program also demonstrates the usage of the `vg_lite_draw` API with which draws a highlighted rectangle on the top-right icon in above image. The program defines a path (`path_data[]`) for a 10x10 square bounding box, and it sets up a proper “highlight_matrix” to translate/scale the 10x10 square to cover the top-right icon. The `vg_lite_draw` API call uses blend parameter `VG_LITE_BLEND_SRC_OVER` and blend color 0x22444488 (alpha value 0x22) to draw a semi-transparent rectangle on the top-right icon.

```
static char path_data[] = {
    2,  0,  0,          // moveto    0,  0
    4, 10,  0,          // lineto   10,  0
    4, 10, 10,          // lineto   10, 10
    4,  0, 10,          // lineto    0, 10
    0,                  // end
};

static vg_lite_path_t path = {
    {-10, -10, 10, 10}, // bounding box left, top, right, bottom
    VG_LITE_HIGH,        // quality
    VG_LITE_S8,          // -128 to 127 coordinate range
    {0},                 // uploaded
    sizeof(path_data),   // path length
    path_data,           // path data
    1                    // path changed
};
```

VGLite API Programming Examples

```
};

error = vg_lite_draw(fb, &path, VG_LITE_FILL_EVEN_ODD,
&highlight_matrix, VG_LITE_BLEND_SRC_OVER, 0x22444488);
```

After the `vg_lite_draw` call, `vg_lite_clear_path(&path)` is called to free and reset the path data.

12.4 `vg_lite_draw_gradient` Example

The *Conformance/samples/linearGrad/linearGrad.c* test program demonstrates the usage of the `vg_lite_draw_grad` API. It defines 5 colors (black, red, green, blue, white) in `ramps[]` and 5 stops in `stops[]` which are used for gradient color transition. It calls the following to setup the color gradient image.

```
vg_lite_uint32_t ramps[] = {0xff000000, 0xffff0000, 0xff00ff00,
0xff0000ff, 0xffffffff};
vg_lite_uint32_t stops[] = {0, 66, 122, 200, 255};
vg_lite_set_grad(&grad, 5, ramps, stops);
vg_lite_update_grad(&grad);
```

Note that the “colors” parameter (`ramps[]`) in `vg_lite_set_grad` API must be in ARGB8888 format with alpha at the higher byte.

It also sets up the gradient transformation matrix “`matGrad`” with a proper scale factor and 30 degree rotation.

```
matGrad = vg_lite_get_grad_matrix(&grad);
vg_lite_identity(matGrad);
vg_lite_rotate(30.0f, matGrad);
```

Then it calls:

```
vg_lite_draw_grad(fb, &path, VG_LITE_FILL_EVEN_ODD, &matPath, &grad,
VG_LITE_BLEND_NONE);
```

with a ploygon path and color gradient image/matrix so that it generates the rendering effect as illustrated in the image below.

After the draw gradient API, it calls:

```
vg_lite_finish();
vg_lite_clear_grad(&grad);
```

to flush the VGLite commands and clean up the gradient image buffer.

Figure 3 Example using `vg_lite_draw_gradient`

VGLite API Programming Examples

12.5 vg_lite_draw_pattern Example

The *Conformance/samples/patternFill/patternFill.c* test program demonstrates the usage of the `vg_lite_draw_pattern` API. It defines a `vg_lite_path_t` path for a convex polygon shape as shown below, and loads an image file "landscape.raw" with which to fill the polygon interior area.

It also defines two matrices, one named "matrix" for the image, another named "matPath" for the "path". The image matrix rotates the image 33 degrees clockwise based on the image center.

```
vg_lite_identity(&matrix);
vg_lite_translate(fb_width / 2.0f, fb_height / 4.0f, &matrix);
vg_lite_rotate(33.0f, &matrix);
vg_lite_scale(0.4f, 0.4f, &matrix);
vg_lite_translate(fb_width / -2.0f, fb_height / -4.0f, &matrix);

vg_lite_identity(&matPath);
vg_lite_translate(fb_width / 2.0f, fb_height / 4.0f, &matPath);
vg_lite_scale(10, 10, &matPath);
```

Then it calls `vg_lite_draw_pattern` API two times with different parameters to draw the polygon twice.

```
error = vg_lite_draw_pattern(fb, &path, VG_LITE_FILL_EVEN_ODD,
&matPath, &image, &matrix, VG_LITE_BLEND_NONE, VG_LITE_PATTERN_COLOR,
0xffaabbcc, VG_LITE_FILTER_POINT);

error = vg_lite_draw_pattern(fb, &path, VG_LITE_FILL_EVEN_ODD,
&matPath, &image, &matrix, VG_LITE_BLEND_NONE, VG_LITE_PATTERN_PAD,
0xffaabbcc, VG_LITE_FILTER_POINT);
```

With the `vg_lite_pattern_mode_t` setting of `VG_LITE_PATTERN_COLOR`, the polygon area outside the pattern image of the upper polygon is filled with color `0xffaabbcc`. With the `vg_lite_pattern_mode_t` setting of `VG_LITE_PATTERN_PAD`, the polygon area outside the pattern image of the lower polygon is filled with the border pixel color of the pattern image.

Figure 4 Example using `vg_lite_draw_pattern`

VGLite API Programming Examples

12.6 Vector-based Font Rendering Example

The *Conformance/samples/glyphs2/glyphs2.c* test program demonstrates vector-based font rendering with the `vg_lite_draw` API, which is capable of drawing quadratic curves and cubic curves based on end point and control point coordinates in the path data. The font path data can be generated by using a third-party font engine that can produce VGLite path data directly, or by using VeriSilicon's VGLite tools to convert other formats of font data, such as SVG, etc., to VGLite path data. Here is an example of path data for the character "~" (ASCII code 126):

```
float ascii_font_126[] =
{
    2,15.984375,20.273438,
    4,16.296875,20.476563,
    6,15.781250,21.351563,14.921875,21.992188,
    6,13.953125,22.710938,13.046875,22.710938,
    6,12.375000,22.710938,10.898438,22.203125,
    6,9.421875,21.695313,8.656250,21.695313,
    6,7.937500,21.695313,7.375000,22.117188,
    6,7.015625,22.382813,6.421875,23.117188,
    4,6.109375,22.914063,
    6,7.593750,20.664063,9.453125,20.664063,
    6,10.156250,20.664063,11.492188,21.140625,
    6,12.828125,21.617188,13.531250,21.617188,
    6,14.921875,21.617188,15.984375,20.273438,
    0
};
```

The first integer in each line is the path opcode, followed by the coordinates for each opcode. As listed in Section 8.4, opcode (2, x, y) moves the current position to (x, y); opcode (4, x, y) draws a line from the current position to (x, y); opcode (6, cx, cy, x, y) draws a quadratic curve from the current position to the given end point (x, y) using the specified control point (cx, cy).

The program calls:

```
error = vg_lite_init(256, 256);
```

to initialize VGLite with a 256x256 path tessellation buffer, then allocates a 320x320 render buffer with the format `VG_LITE_RGBA8888`. The size of the tessellation buffer is big enough to cover the font character bounding box.

The program renders the path for each character in the string "Hello,\nVerisilicon!" in a loop with calls to:

```
/* Draw the path using the matrix.*/
error = vg_lite_draw(fb, &path, VG_LITE_FILL_EVEN_ODD, &matrix,
VG_LITE_BLEND_NONE, 0xFF0000FF);
```

The character's vector path is rendered without blending (`VG_LITE_BLEND_NONE`). The path interior is filled with the color red (`0xFF0000FF`).

VGLite API Programming Examples

**Figure 5** Example using Vector Based Font Rendering

To demonstrate the smooth curve of vector-based path rendering with any scale factor, the program renders a single character “H” with a scaled size of 8X using following API calls.

```
vg_lite_identity(&matrix);  
vg_lite_translate(startX, startY, &matrix);  
vg_lite_scale(8.0, 8.0, &matrix);  
error = vg_lite_draw(fb, &path, VG_LITE_FILL_EVEN_ODD, &matrix,  
VG_LITE_BLEND_NONE, 0xFF0000FF);
```

The following image example shows the resulting vector path rendering of character “H”.

**Figure 6** Example with Vector Based Font Rendering Upscaled 8X
